## **SPARE PARTS LIST**

**CONCRETE BURSTING SYSTEM AU/SP/CP**

## PREFACE

Dear customers,

congratulations on having decided to buy a HYDROSTRESS system - you acquired a highly sophisticated and reliable state-of-the-art unit.

Due to our special efforts in the field of quality assurance, the concrete bursting system AU/SP/CP is a further Swiss, top-of-the-range product:

- unmatched weight per unit of drive
- reliable operation
- high mobility
- easy handling

This manual contains any information required for operation, maintenance, and ordering of spare parts. The exclusive use of genuine HYDROSTRESS spare parts ensures quality and interchangeability.

In the case of neglected or inappropriate maintenance, we refuse to accept any warranty commitment as specified in our terms of delivery.

Any repair work is to be carried out by trained specialists exclusively.

Should you need to know more details concerning your HYDROSTRESS system in order to keep it in perfect condition, please contact our after-sales service for further information.

We would be pleased to hear that working with your HYDROSTRESS system was without any difficulties and troublefree.

**HYDROSTRESS® AG**

### The Management

These instructions are only valid for the concrete bursting system AU/SP/CP, mutation code 002 (see type plate). Technical modifications reserved that do not affect handling and function.

3. Edition July 1992, mutation code 003

Voltage is supplied to the electric motor M (1, Fig. 2-6) via the switch case. The electric motor permanently drives the radial piston pump (2).

Via the suction filter (6) the radial piston pump sucks the hydraulic oil from the oil reservoir (24) and supplies three connected hydraulic circuits via two outputs (main and secondary output):

- the ND circuit for driving the motor of the control unit (11) and for the piston return;
- the booster circuit for driving the booster (13);
- the HD circuit for bursting.

The circuits are controlled by means of the control valve (10):

**Control valve in position 0  
(circulation):**

The hydraulic oil is pumped over without pressure: from the secondary output via control valve (10), from the main output via the directional control valve 3/2 (9) into the oil reservoir (24).

**Control valve in position I  
(bursting):**

Via the secondary output the motor of the control unit (11) and the directional control valve 3/2 (9) are operated. When the directional control valve 3/2 (9) is activated, the hydraulic oil flows from the main output to the booster (13) via the valve of the control unit (12). Via the control unit the motor of the control unit activates the valve of the control unit (12) which in turn controls the operation of the booster (13).

When the red shut-off valve (15) of the HD cock (14) is open and the blue shut-off valve is closed, the piston of the burster element is impinged with pressure and extends.

Return into the oil reservoir is carried out via the plug-type nipple (21) and the control valve (10). The burster elements can individually be impinged with pressure or be relieved by means of the red shut-off valve (15) or the blue pressure controller (16).

**Control valve in position II  
(return):**

Via the secondary output and the control valve (10) the pistons of the burster elements (26) are impinged with pressure at the low-pressure side and retract. The hydraulic oil from the main output flows back to the oil reservoir without pressure via the directional control valve (9).

The accumulator (7) in the booster circuit neutralizes pressure variations. The indication of the pressure gauge (18) (booster or ND circuit) is controlled via the shuttle valve (19).

# OPERATING ELEMENTS/CONNECTIONS AU/SP/CP

## 3 OPERATING ELEMENTS AND CONNECTIONS

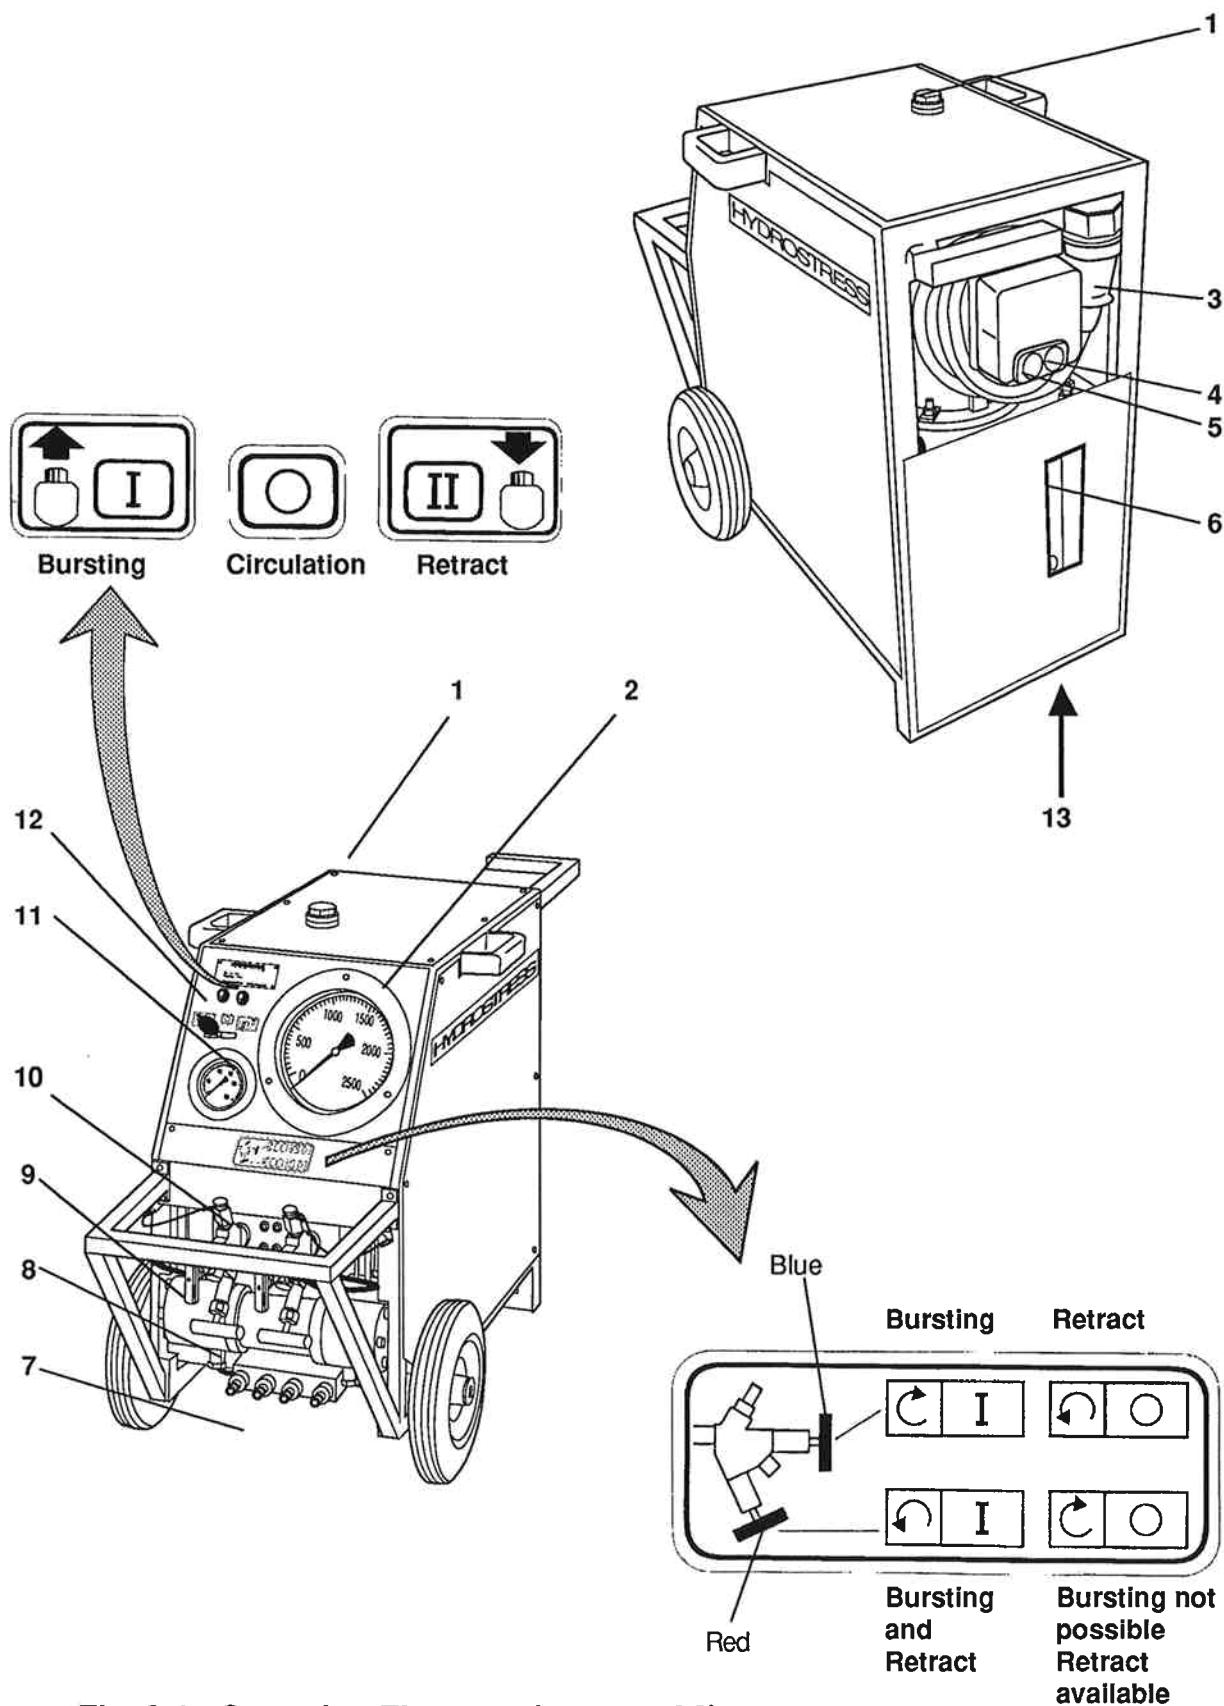

Fig. 3-1 Operating Elements (page 1 of 2)

In this manual we use the following remarks:

**CAUTION**

This headline indicates that any inappropriate compliance or noncompliance of instructions or procedures may cause injuries or fatal accidents.

**IMPORTANT**

This headline indicates that any inappropriate compliance or noncompliance of instructions or procedures may damage the unit.

**NOTICE**

The headline indicates an important feature.

Please observe any instructions and safety regulations attached to the unit.

**Abbreviations:**

- ETL - Spare parts list
- NA - Not shown in the illustration
- Fig. - Figure
- Tab. - Table
- HD - High pressure
- ND - Low pressure
- SW - Opening of the spanner
- Ø - Diameter

In the following description the power pack AU will only be referred to as the "unit".

# AU/SP/CP OPERATING ELEMENTS/CONNECTIONS

Pos.	Designation	Marking	Function/Indication
1	Reservoir cap	HYDRAULIC	Filling in hydraulic oil
2	HD pressure gauge	bar/P1	Indication of pressure in the HD circuit
3	Mains cable		Mains supply 380 V/50 Hz, CEE 16
4	Switch ON	GREEN	Switches the unit on
5	Switch OFF	RED	Switches the unit off
6	Oil level indicator	MIN/MAX	Level of hydraulic oil in oil reservoir
7	Plug-type nipple of return connection		Connection of ND hose
8	Shut-off valve RED	RED	Open: HD cock is opened Bursting and Retract possible Closed: HD cock is closed Bursting not possible
9	Pressure control valve BLUE	BLUE	Open: The pressure in the HD circuit is reduced to zero Closed: Pressure build-up in the HD circuit
10	HD connection Plug-type nipple		Connection of the HD hose with protective cap
11	ND pressure gauge	bar/P2	Indication of pressure in the ND range or in the booster circuit
12	Control valve	I/O/II	Position I: Bursting Position 0: Pressureless circulation Position II: Retract
13	Oil drain plug		Draining the hydraulic oil from the oil reservoir

Fig. 3-1 Operating Elements (page 2 of 2)

## GENERAL SAFETY REGULATIONS

Please read these safety regulations very CAREFULLY!

-  **The concrete bursting system must only be used for crushing concrete. HYDROSTRESS refuses any warranty and liability if the unit is not used for its intended purpose.**
-  **This unit operates at high pressure (2000 bar). Check the unit as well as the burster elements before starting your work according to our instructions (see cap. 5).**
-  **Make sure that the hydraulic lines cannot be damaged by falling concrete pieces.**
-  **Never connect or disconnect hoses or handle the burster elements when the unit is running or is under pressure.**
-  **Before carrying out any maintenance and repair works make sure that the unit is currentless and that there is no pressure in the hydraulic system.**
-  **Connect only HYDROSTRESS equipment to the unit. HYDROSTRESS refuses any liability if other than genuine equipment was used.**
-  **Only genuine HYDROSTRESS spare parts will ensure the perfect operation of the unit. HYDROSTRESS declines any liability for damages resulting from the use of other than genuine components.**
-  **Observe all general and specific regulations for prevention of accidents of the relevant professional and insurance associations.**

**SAFETY REGULATIONS FOR PREVENTION OF ACCIDENTS****CAUTION**

Nonobservance of the following safety regulations implies risk of accident.

-  Only instructed personnel, familiar with the system, are allowed to operate the bursting system.
-  Protect the working area from concrete pieces which come falling down. Secure the danger area by information signs or by barriers.
-  Do not lift the unit by means of a hemp rope (95 kg).

## TECHNICAL DATA AU

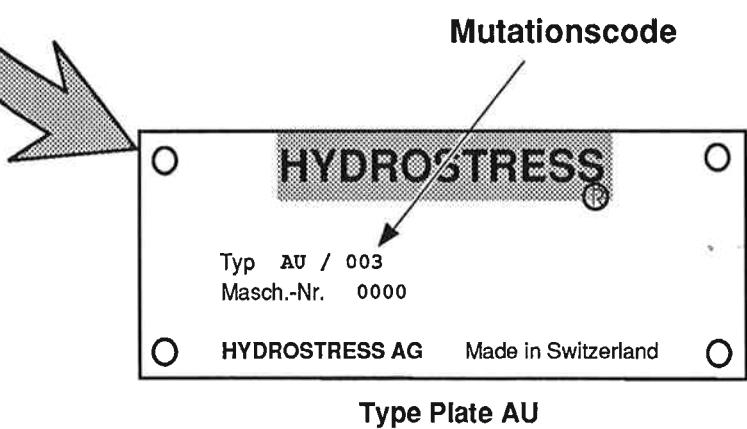

<b>Total weight:</b>	95 kg
<b>Driving motor</b>	Electric motor
- Power supply	380 V/50 Hz, 5-lead cable, 2.5 mm <sup>2</sup>
- Power consumption	10 A at maximum load
- Output	2.2 kW (3 HP)
- Type of protection	IP 44
- Revolutions/min	2850 rpm
- Overload protection	Protective motor switch
<b>Electric control:</b>	
- Protective motor switch	Thermal type (heat package)
- Operation	On/Off switch on protective motor switch
<b>Hydraulic design:</b>	
- Tank capacity	13 l
- Flow rate	30 l/h, 2000 bar
- Hydraulic circuits	3 closed circuits
	- HD circuit 2000 bar max.
	- Booster circuit 80 bar max.
	- ND circuit 150 bar max.
- Possible connections	5 burster elements max. (with HD 4-way distributor)
- Force of pressure	2000 bar max.
- Radial piston pump	Prim. output: 14.4 l/min, 80 bar Sec. output: 2.4 l/min, 150 bar
- Filter refinement	10 µm
- Oil quality	Recommended: - Mobilfluid 316 or - Mobil D.T.E. 15
- Length of hose packages	For further details please refer to section „Maintenance“ 5 m

(Dimensions in mm)

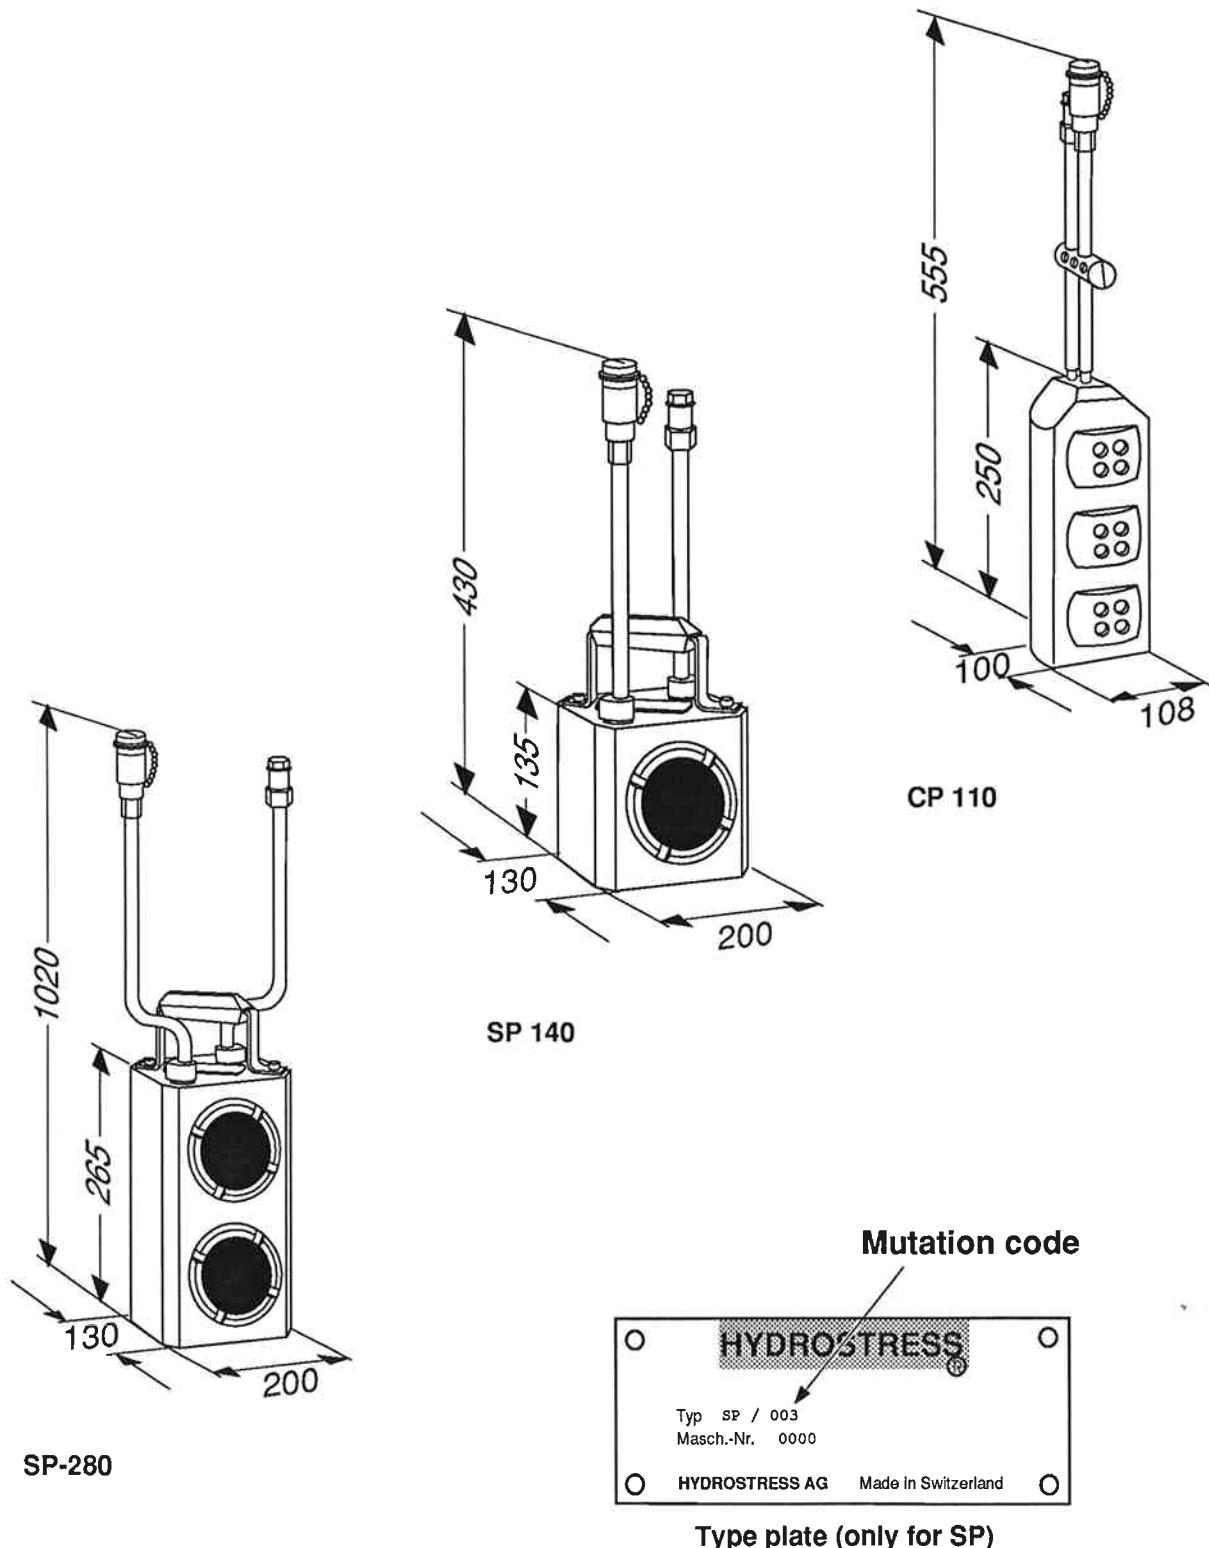

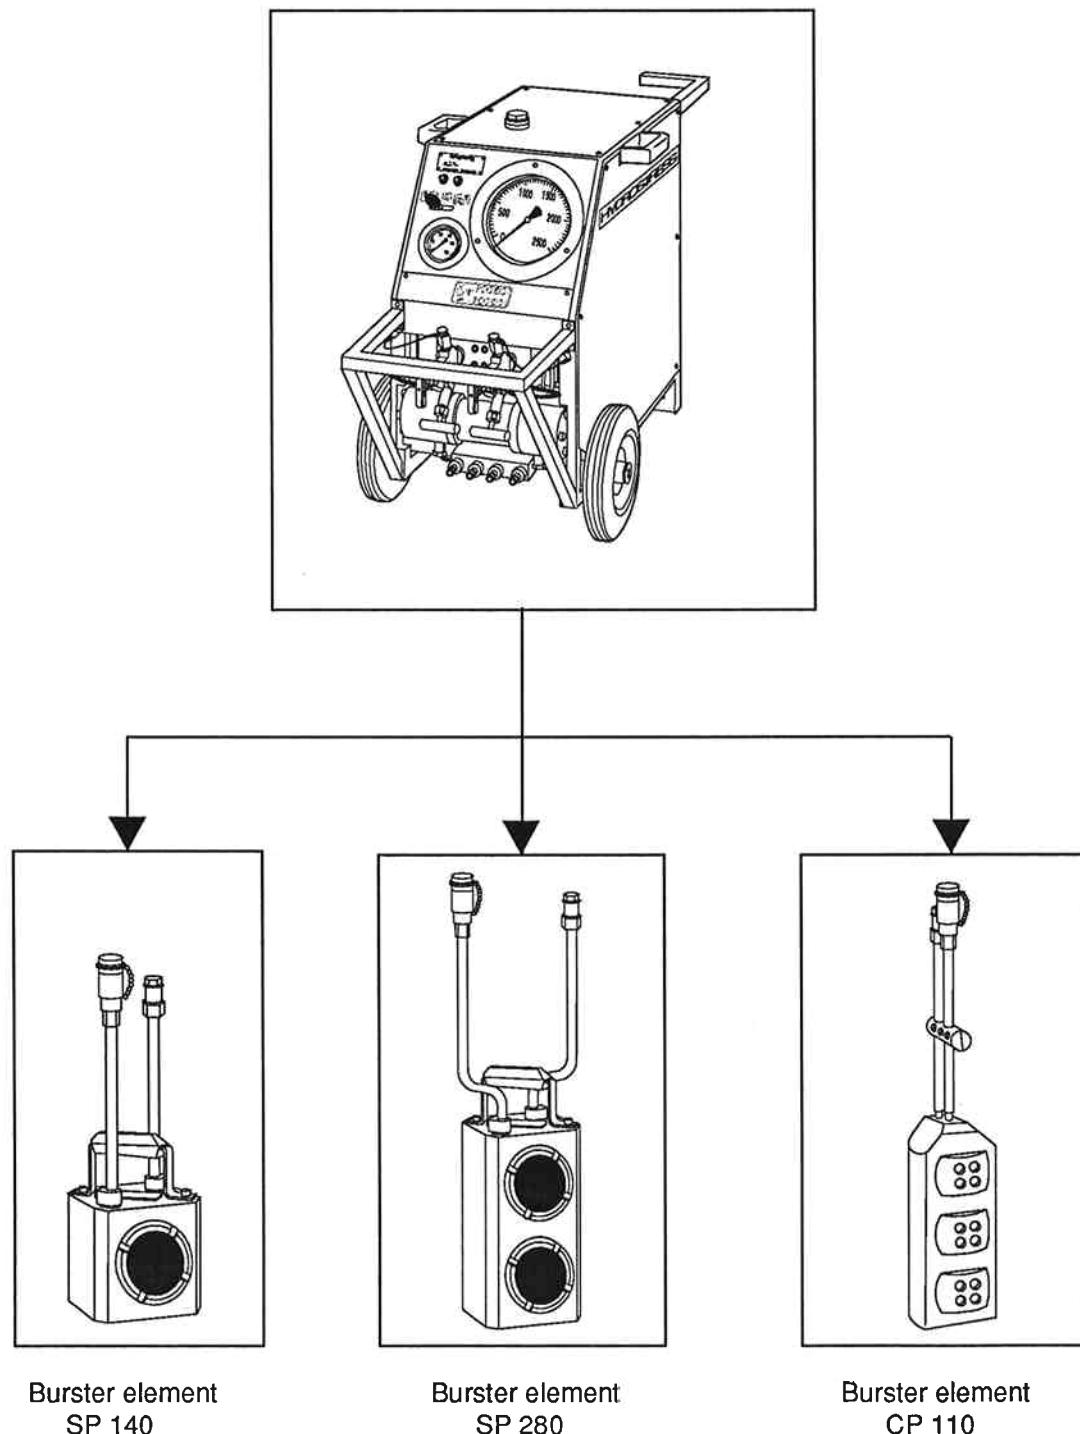

Fig. 0-2 Dimensions, Type Plate Burster Elements

## 1 RANGE OF APPLICATION

### 1.1 Connectable Burster Elements

Up to 5 burster elements can be connected to the unit (see Tab. 1-1).

**Fig. 1-1 Connectable Burster Elements**

## 1.2 Connectable Units

The burster elements SP/CP can be operated by the unit described in this manual or by the petrol-operated power unit 4B-3000.

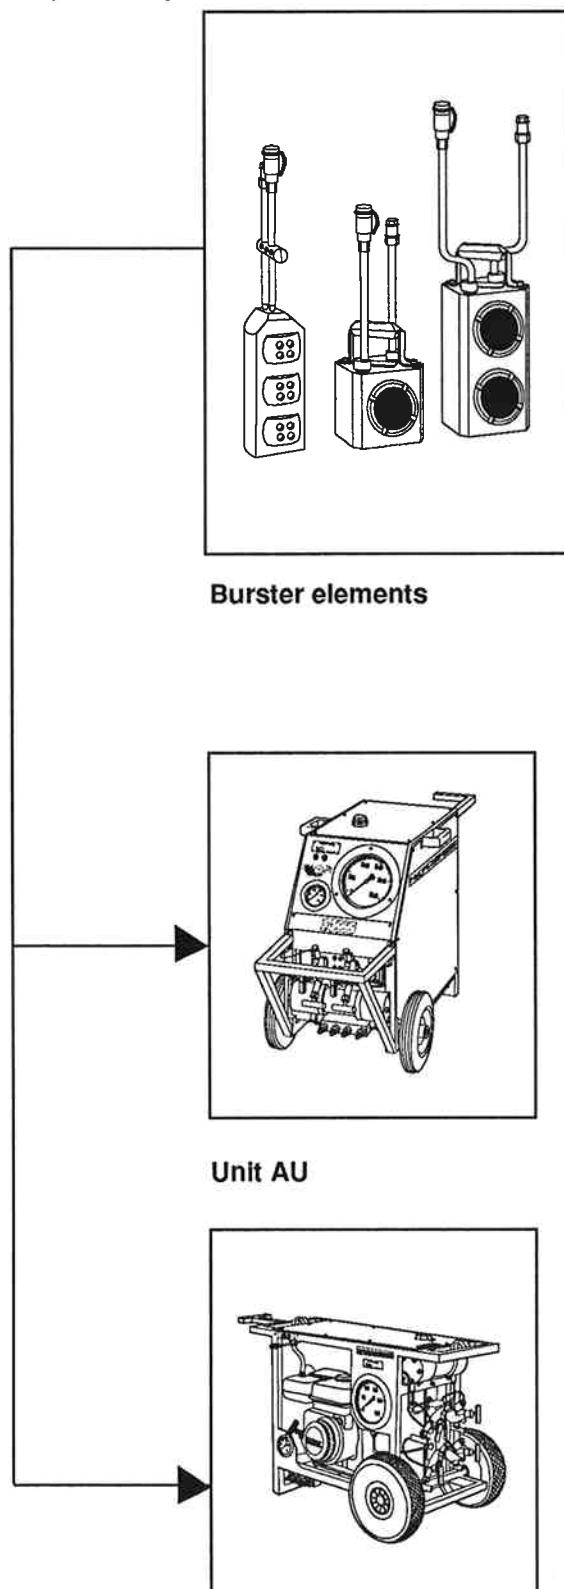

Fig. 1-2 Connectable Units

## 1.3 Possible Applications

- Demolition of walls
- Enlarging of cutouts in walls and floors
- Removal of foundations, piers, and bearers.

Number	SP 140	SP 280	CP 110
1	max. 125 t	max. 250 t	max. 110 t
2	max. 250 t	max. 500 t	max. 220 t

8*	max. 1000 t	max. 2000 t	max. 880 t

\* only with HD 4-way distributor

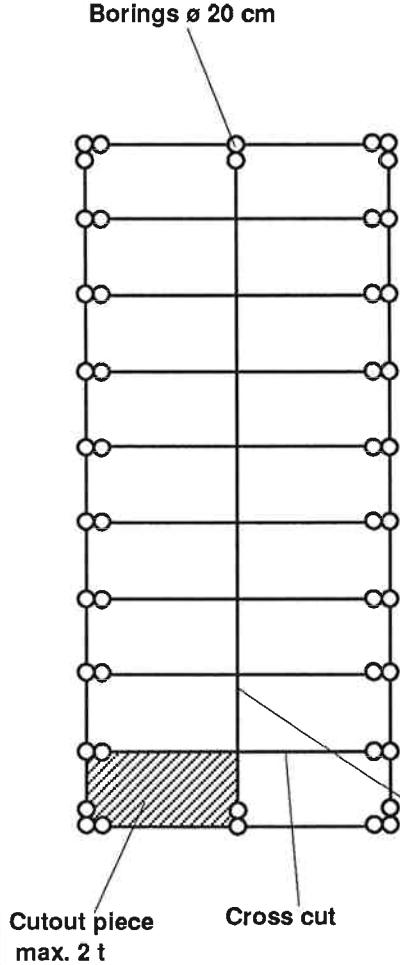

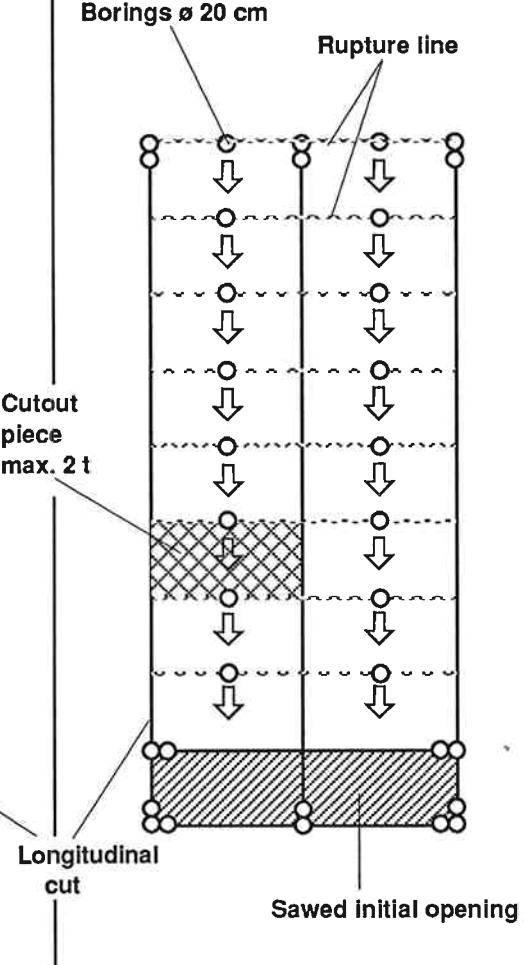

Tab. 1-1 Connection to Unit AU

## 1.4 Example of Application

An opening of a length of 10 m and a width of 3 m is to be cut out of a concrete floor showing a thickness of 50 cm. The fragments cut out must not be heavier than 2 t. The cuts must not exceed beyond the corners. Two variants are shown for the expenditure of work concerning the cutout of the opening ( see Tab. 1-2)

Results of the example of application:

	Drilled depth	Sawed surface
Work expenditure without concrete bursting system	24 m	30 m <sup>2</sup>
Work expenditure with concrete bursting system	17 m	18 m <sup>2</sup>
Saving with concrete bursting system	7 m	12 m <sup>2</sup>

Tab. 1-2 Cutouts With and Without Burster Element

## 2 DESIGN AND FUNCTION

### 2.1 Design AU

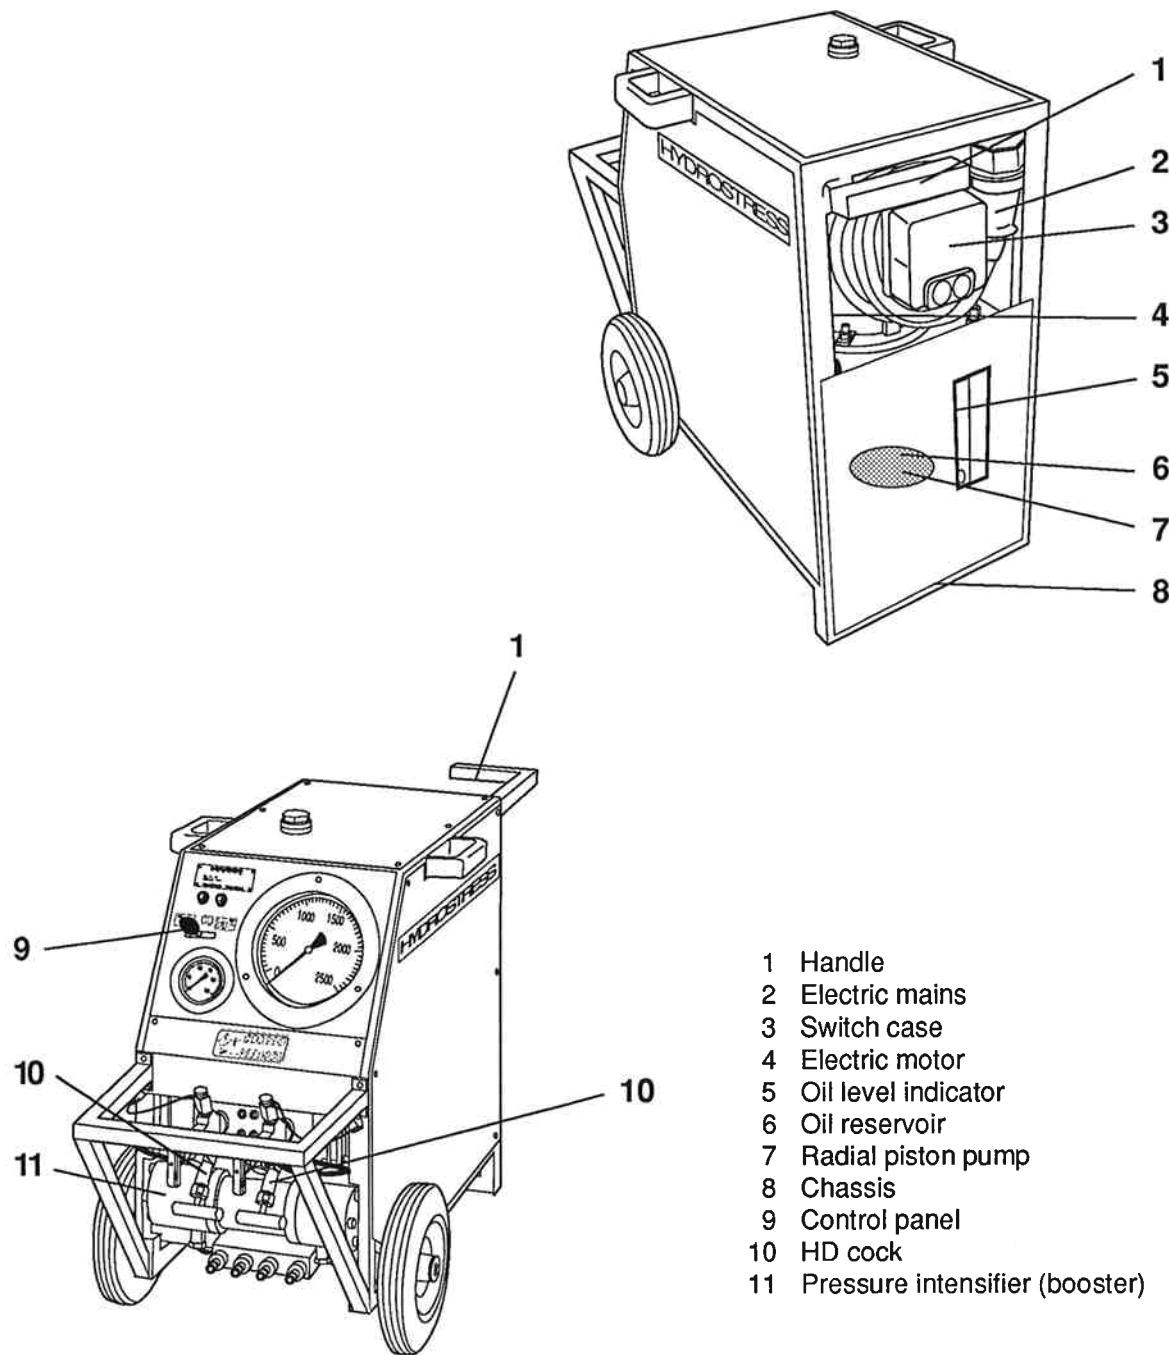

Fig. 2-1 Design AU

The unit is mounted into a chassis (8, Fig. 21-) consisting of a robust steel tube frame. The control panel (9) and the two HD cocks (10) are located at the front side, the switch case (3), the electric mains (2), the oil level indicator (5) and the sliding handle (1) are on the rear side.

- Drive Unit:** The drive unit is mounted in the rear part of the chassis. It consists of the electric motor (4) and the radial piston pump (7).
- Control panel:** The control panel comprises the operating and indication elements for the control of the hydraulic system (see section 3). The two HD cocks (10), the booster (11), and the hydraulic connections are placed beneath the control panel.
- Oil reservoir:** It is mounted in the lower part of the chassis. The filling neck with filter is located on top of the cover plate. The radial piston pump (7) with suction filter and further components of the hydraulic system are installed in the oil reservoir (6).
- Switch case:** The On/Off switches (red/green) for the electric motor and the mains cable (2) are fixed to the switch case.
- Hoses:** Required for each burster element:  
 - 1 high pressure hose (HD)  
 - 1 low pressure hose (ND)
- Booster:** The booster is a pressure intensifier. It increases the working pressure of the booster circuit at a rate of 1:25. This means that the pressure within the booster circuit increases to a pressure of 2000 bar in the high pressure circuit.

## 2.2 Design SP/CP

### NOTE

The number of burster pistons excepted, the construction principle of the burster elements SP 140, SP 280, and CP 110 is the same. An example for the design is given by burster element CP 110.

The burster element CP 100 consists of the casing (3, Fig. 2-2), the three burster pistons (4), and the two connection lines (1, 2) for the high and low pressure circuits. The burster heads (5) of the CP 100 are screwed to the burster pistons and can easily be replaced. The burster piston is sealed by a piston sealing ring (7), the O-ring (8) and the oil wiper ring (11).

For SP 140 and SP 280 the two connection lines (1, 2) are available in two lengths.

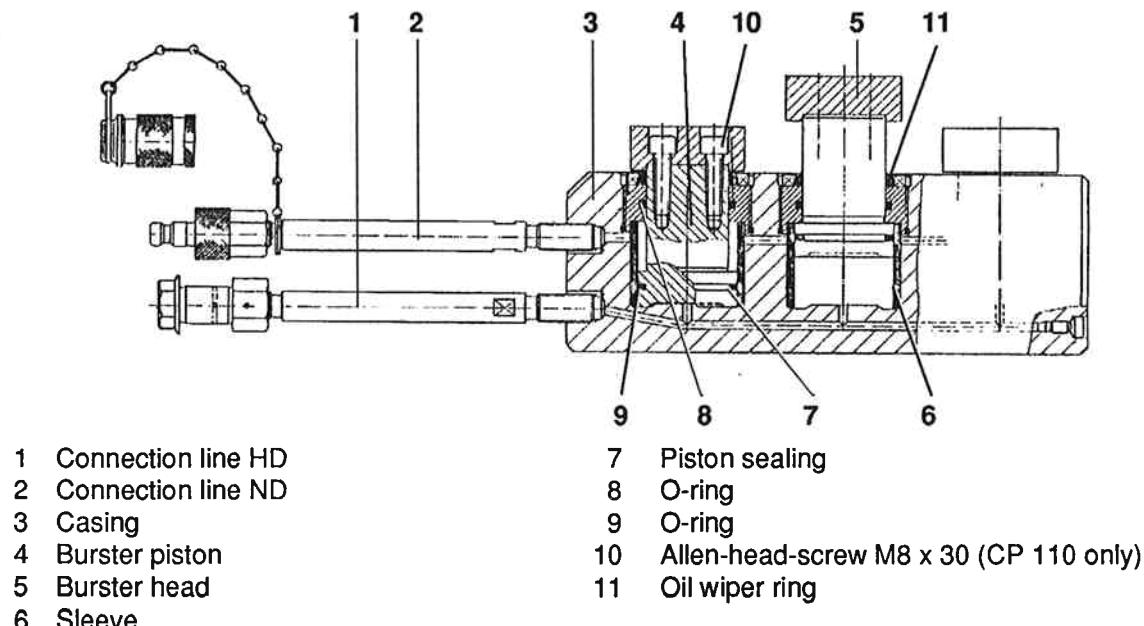

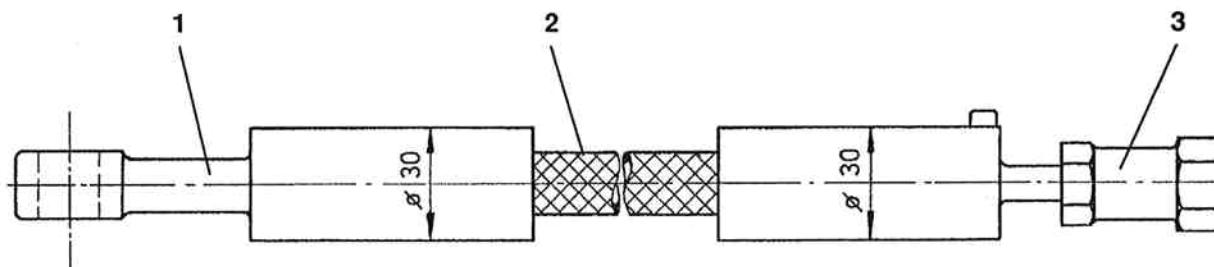

Fig. 2-2 Design of Burster Elements SP/CP

## 2.3 Design HD Hose

The HD (high pressure) hose is a hose with double shell (2, Fig. 2-3). In case of leakages or even rupture of the inner shell the hydraulic oil and the existing pressure are caught and retained by the outer shell. At the connection side to the unit the HD hose is provided with a screw-type HD fitting (3) and the connection side to the burster element with a plug-type HD fitting (1). These fittings need special care when in use. The plug-type fitting can be replaced by a screw-type fitting.

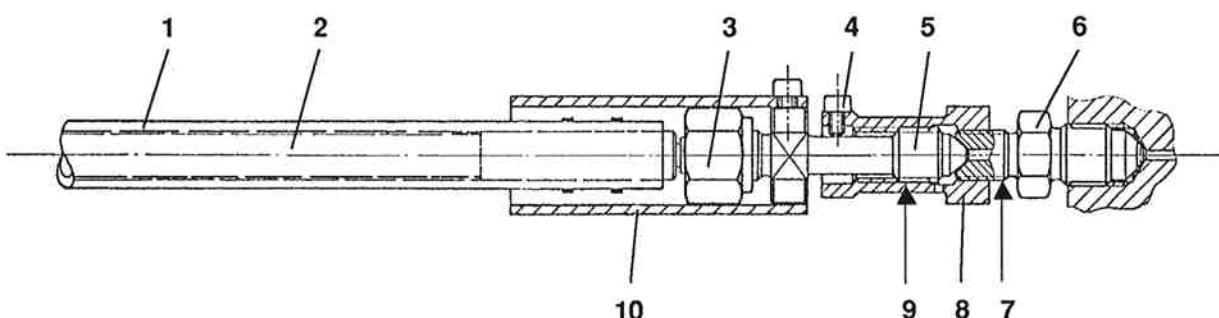

- 1 Plug-type fitting
- 2 Double shell hose
- 3 Screw-type fitting

**Fig. 2-3 HD Hose**

## SCREW-TYPE FITTING

The screw-type fitting consists of the plug-type nipple (5, Fig. 2-4), the gripping tube (10) and the tensioning nut (8). The inside of tensioning nut with left-handed thread sits on the plug-type nipple (5). The stop screw (4) prevents the tensioning nut (8) from being screwed off.

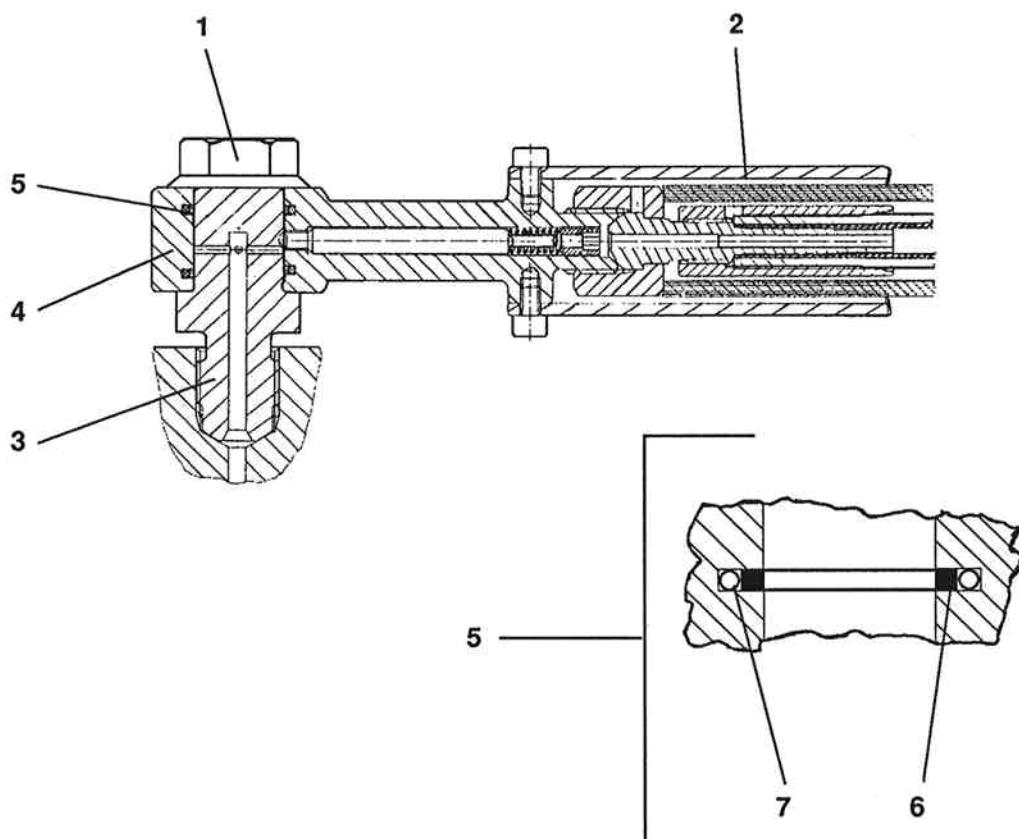

The tensioning nut is screwed onto the HD connection with its right-handed thread (7). Left-handed and right-handed thread are working in opposite direction, thus enabling an especially frictional connection of the sealing surfaces.

- |   |   |
|---|---|
| 1 Outer hose shell<br>2 Inner hose shell<br>3 Union nut<br>4 Stop screw<br>5 Plug-type nipple | 6 HD connection at HD cock<br>7 Right-handed thread<br>8 Tensioning nut<br>9 Left-handed thread<br>10 Gripping tube |
|---|---|

**Fig. 2-4 HD Screw-Type Fittings**

## HD PLUG-TYPE FITTINGS

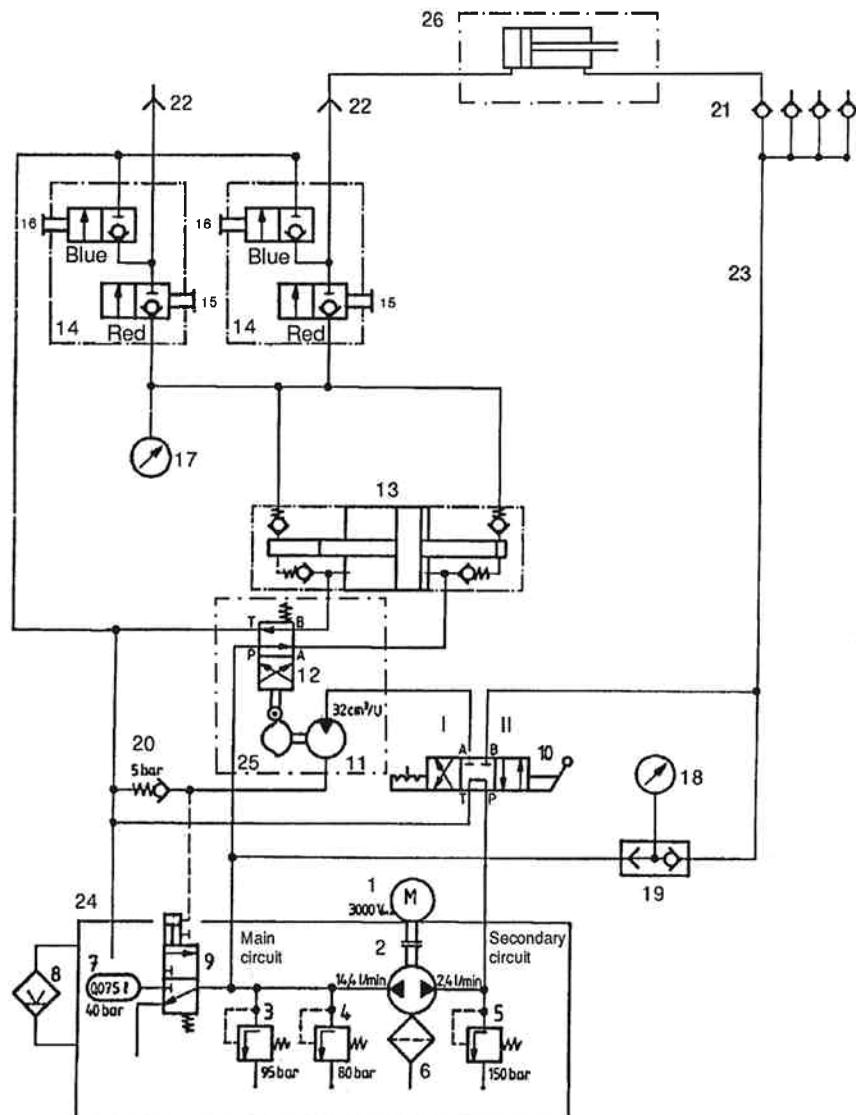

- 1 Nut
- 2 Gripping tube
- 3 Plug-type nipple
- 4 HD plug-type coupling

- 5 KSD Sealing, 2 parts
- 6 Sealing
- 7 O-ring

**Fig. 2-5 HD Plug-Type Fittings**

The plug-type fitting consists of the HD plug-type coupling (4, Fig. 2-5) with the sealings (5) and the gripping tube (2). The plug-type fitting can very easily be attached and removed again. This represents a considerable advantage when handling the burster elements. The HD plug-type coupling (4) and the plug-type nipple (3) match perfectly. Together with the two-piece KSD sealing they form a rotatable hydraulic connection.

## 2.4 Function

Fig. 2-6 Functional Scheme of Hydraulic System

## 4 TRANSPORT

The unit can easily be transported, since it is light-weighted, has good dimensions (see Technical Data) and features a user-friendly technical design.

Please observe the following when transporting unit:

**General:** Make sure that the HD cocks do not touch any obstacles. Damages may lead to difficulties when operating the cocks. Close the hydraulic lines of the burster elements and the HD connections at the unit with dust caps. Slide the handle in for transport purposes. Do not tilt the unit for transport purposes.

The hydraulic system is a closed circuit. There are no leakages during transport.

### CAUTION

Do not use a hemp rope for lifting the unit. Total weight: 95 kg.

**Transport by crane:** For lifting the unit fix the lifting device at the two transport handles on top of the chassis.

**Transport by car:** Secure the unit against shifting and tilting on the loading area. Because of its small dimensions it can also be transported in normal station wagons.

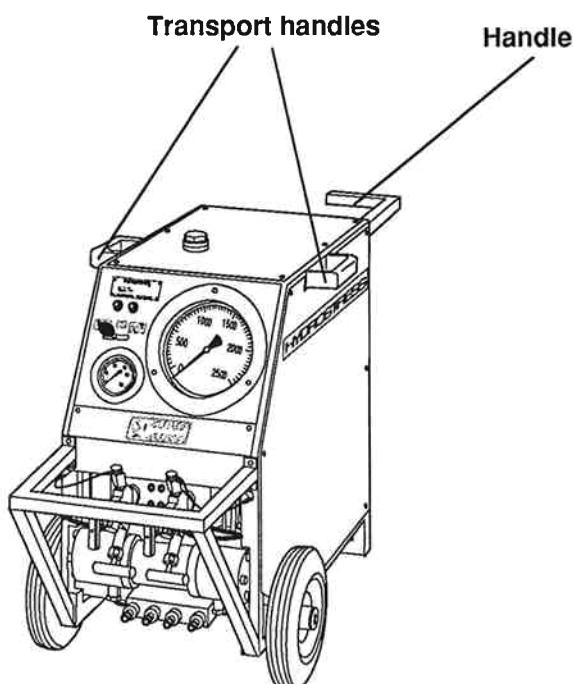

Fig. 4-1 Fastening for Transport

## 5 PREPARATORY OPERATIONS

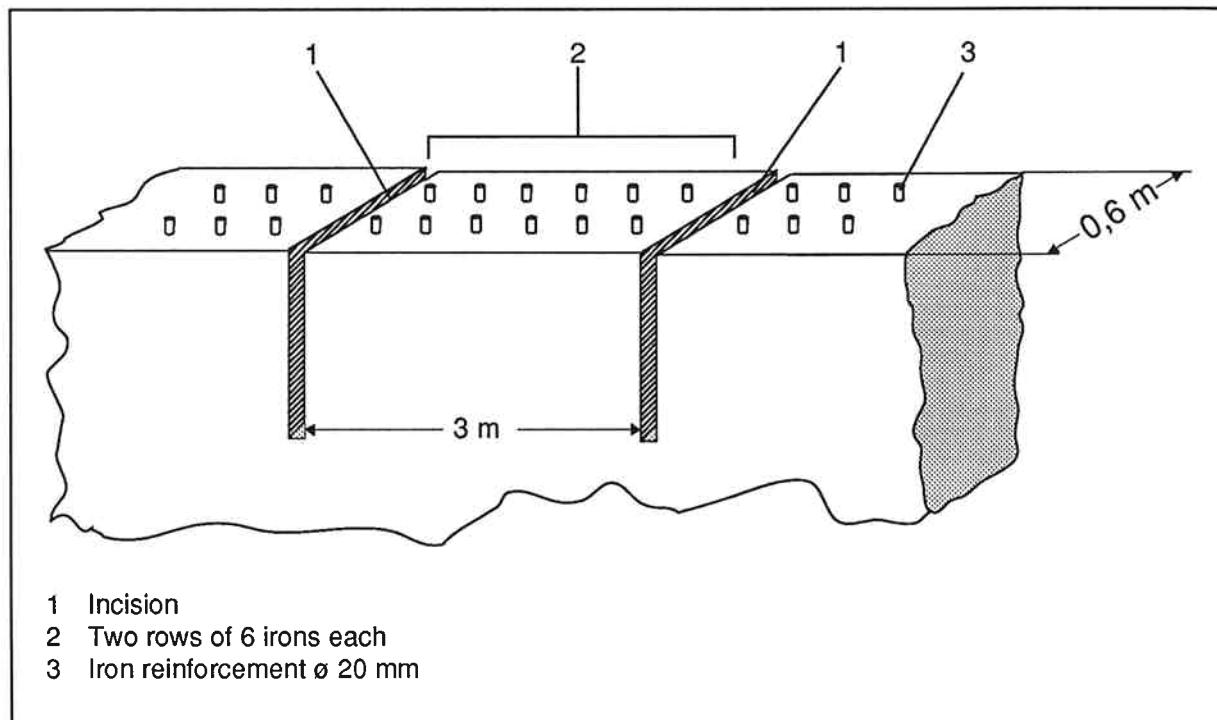

### 5.1 General

Proceed as follows:

1. Concrete reinforcement: Determine the thickness and the position of the iron reinforcement:
  - architect's plan or reinforcement plan
  - test borings
2. Force of pressure: Which force of pressure is needed?  
Determine the minimum force of pressure (see 5.2.1)
3. Built volumes: Make sure that the built volumes to be maintained cannot be damaged or destroyed.
4. Fragments:
  - Which is the maximum admissible weight or size of the fragments?
  - Where can the pieces fall? Consider the weight of concrete (1 m<sup>3</sup> weighs approximately 2.6 t).
5. Construction site: Secure the danger area. No access for unauthorized persons.
6. Maintenance: Carry out the prescribed checks of the unit before starting the works.

## 5.2 Burster elements

Number and type of the appropriate burster elements as well as number and position of the borings are determined on the basis of an example of a concrete wall which has a thickness of 60 cm and is provided with iron reinforcement (Fig. 5-1).

**Fig. 5-1 Concrete Wall with Iron Reinforcement**

### 5.2.1 Calculation of the Minimum Force of Pressure

The required minimum force of pressure must exceed the tensile strength of the iron reinforcement and that of the concrete.

Minimum force of pressure = tensile strength of iron + tensile strength of concrete

Share of iron reinforcement = tensile strength of iron x surface of iron

Share of concrete = tensile strength of concrete x surface of concrete

Tensile strength of iron = max. 80 kg/mm<sup>2</sup>

Tensile strength of concrete = max. 15 t/m<sup>2</sup>

Surface of iron =  $2 \times 6 \times (20 \text{ mm}/2)^2 \times \pi = 3768 \text{ mm}^2$

Surface of concrete =  $3 \text{ m} \times 0.6 \text{ m} = 1.8 \text{ m}^2$

Share of iron reinforcement =  $80 \text{ kg/mm}^2 \times 3768 \text{ mm}^2 = 301440 \text{ kg} \approx 300 \text{ t}$

Share of concrete =  $15 \text{ t/m}^2 \times 1.8 \text{ m}^2 = 27 \text{ t}$

Minimum force of pressure =  $300 \text{ t} + 27 \text{ t} = 327 \text{ t}$

This means that a force of pressure of at least 327 t will be required in order to demolish a piece of wall which has a surface of 1.8 m<sup>2</sup> and is provided with 12 reinforcement irons of Ø 20 mm. According to tab. 1-1 either 3 burster elements type CP 110 or 2 burster elements type SP 280 can be applied for this purpose

### 5.2.2 Position of the Burster Borings

Observe the following indications in order to obtain a defined rupture line for the bursting process:

1. Do not position the borings too near the edges of the concrete piece to be cut out. When the distance to the edges is not sufficient, the material between the boring and the surface can break off (see Fig. 5-2).
2. Do not position the borings too near to one another. When the distance is not sufficient, only the central part is broken off and the edges might be maintained.

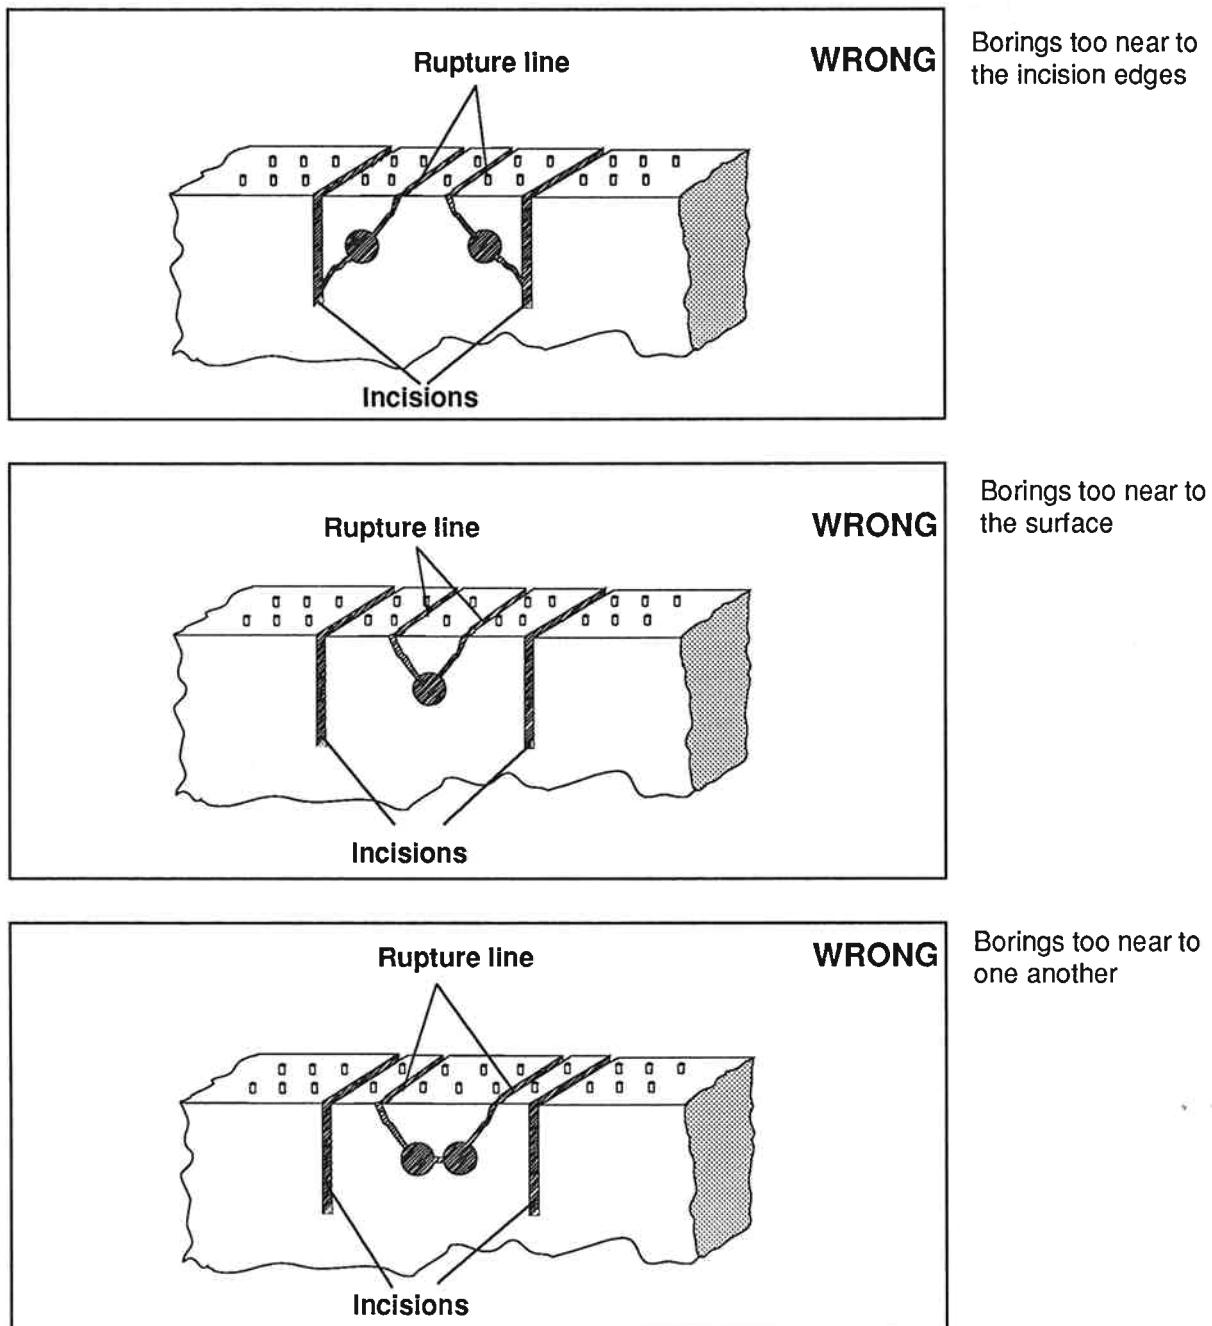

Fig. 5-2 Wrong Position of Burster Borings

3. The best position of the burster borings is shown in Fig. 5-3 for two, and in Fig. 5-4 for 3 burster elements.

## NOTE

- Position the borings regularly along the ideal rupture line (only by doing so you will obtain a constant contact pressure on the overall surface).
- Make sure that the minimum distances are observed ( $1/4 L$  for two burster elements,  $1/6 L$  for three burster elements).
- Make sure that the desired rupture line is in perpendicular position to the iron reinforcement.

4. The borings must have a depth which allows the complete insertion of the burster elements into the borings (Fig. 5-4).

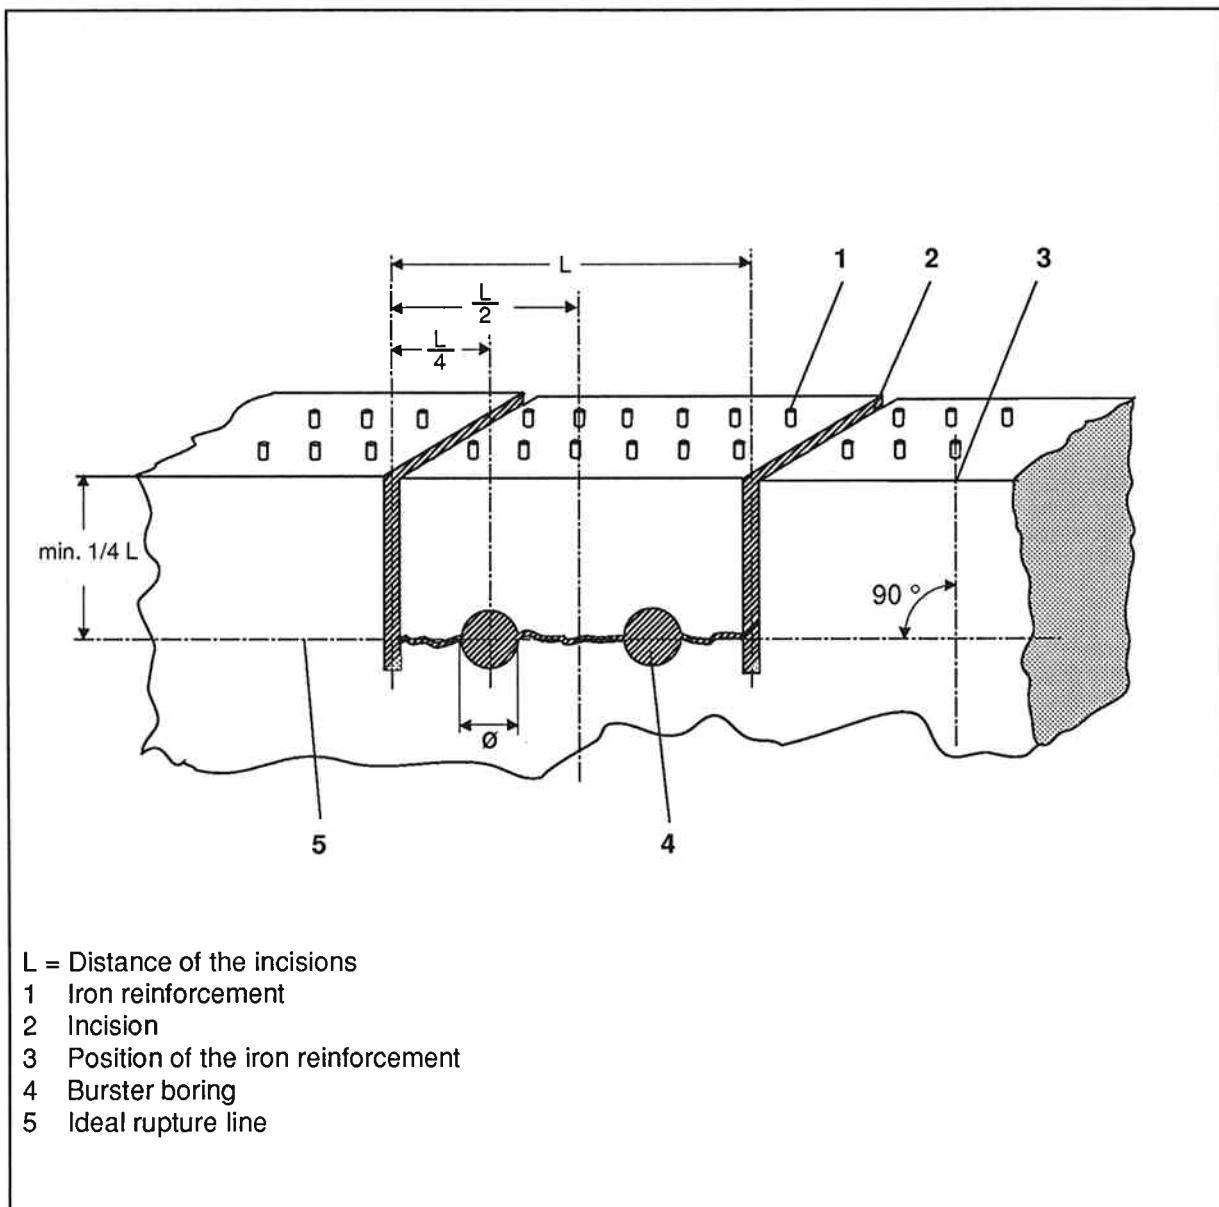

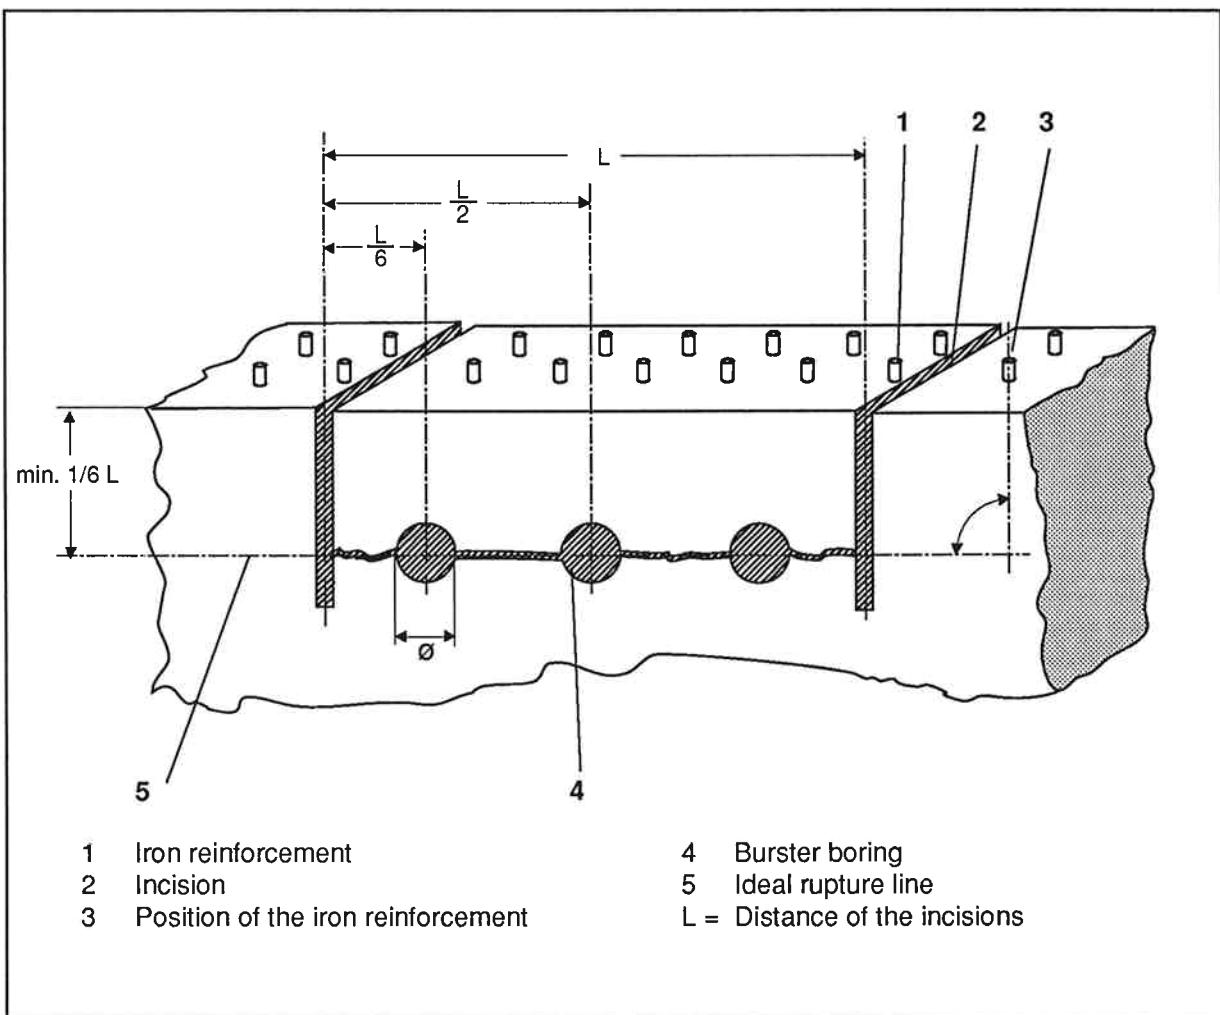

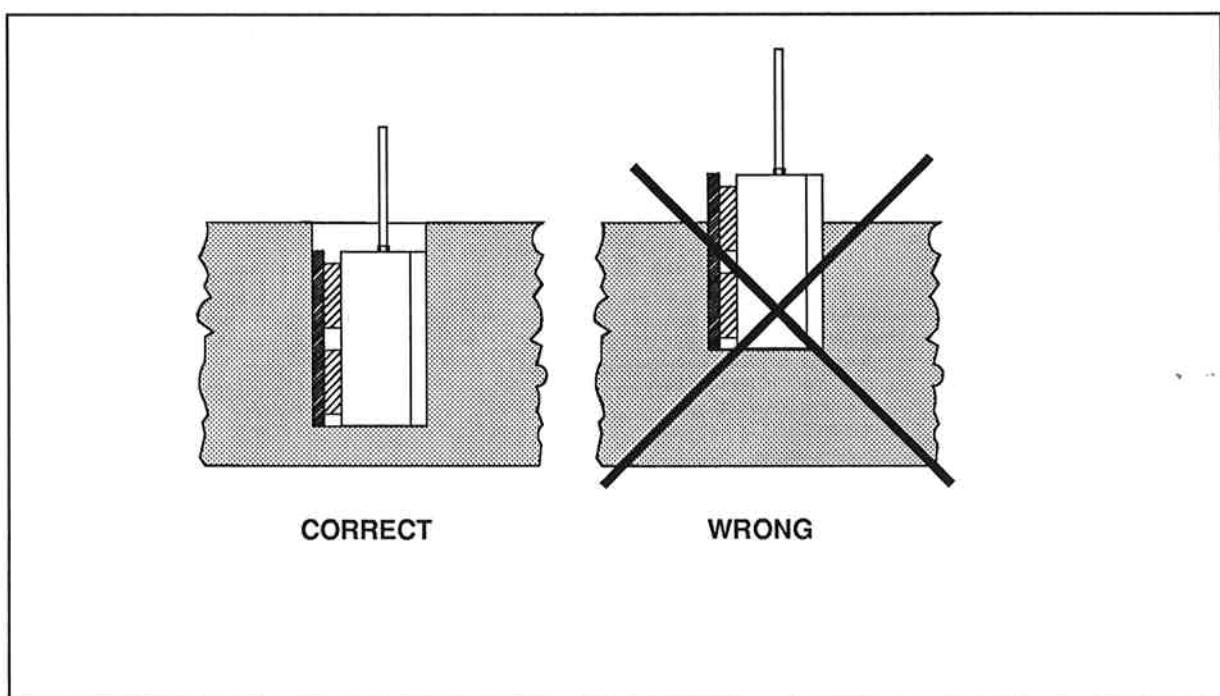

Fig. 5-3 Burster Borings for Two Buster Elements

**Fig. 5-4 Burster Borings for Three Burster Elements**

**Fig. 5-5 Depth of Burster Borings**

## 5.2.3 Application of the Burster Elements

### IMPORTANT

- Make sure that the reaction power of the burster elements cannot damage the built volumes to be maintained (foundations). Before working with the burster elements have the statics checked by a structural engineer.
- HYDROSTRESS declines any liability when the burster elements are not used appropriately.
- Insert the burster elements into the borings so that the pistons are in perpendicular position to the rupture line (see Fig. 5-6).

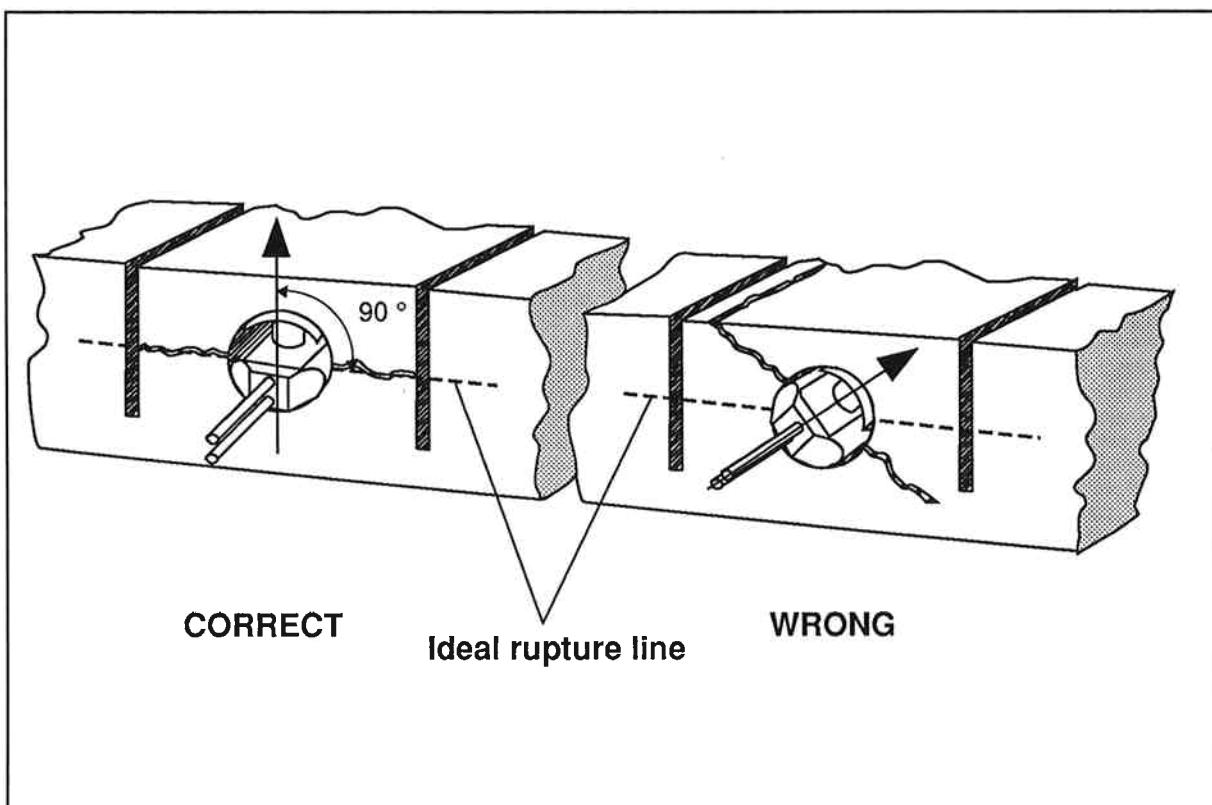

Fig. 5-6 Insertion of Burster Elements into Borings

### IMPORTANT

Insert burster elements SP 140 and SP 280 only together with compression plate.

### 5.3 Unit AU

1. Power supply connection: Minimum fusible cutout: 16 A  
Required connection cable: 5-lead x 2.5 mm<sup>2</sup> cross section
2. Daily visual inspection (see section 7):
  - Oil level (do not fill above maximum level!)
  - Oil loss
  - Dirt accumulation
  - Damages of and dirt accumulations on couplings and HD fittings
  - Damaged hoses

### 5.4 Hose Connections

#### CAUTION

Never connect or disconnect hoses when the unit is running or under pressure. Never force connections.

#### IMPORTANT

Always connect the return hose of the burster element first. Keep the couplings always clean.

Every burster element is connected to the unit by means of a HD hose which is provided with special couplings, and by means of a ND hose.

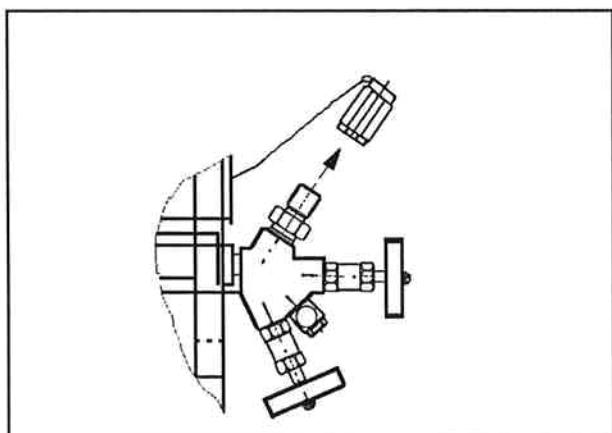

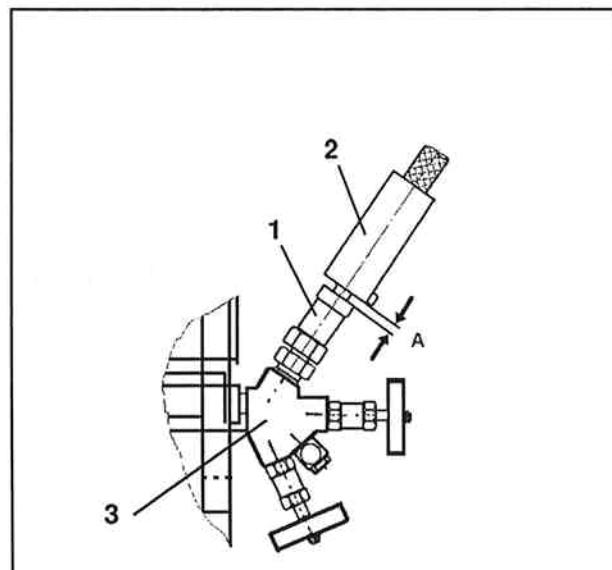

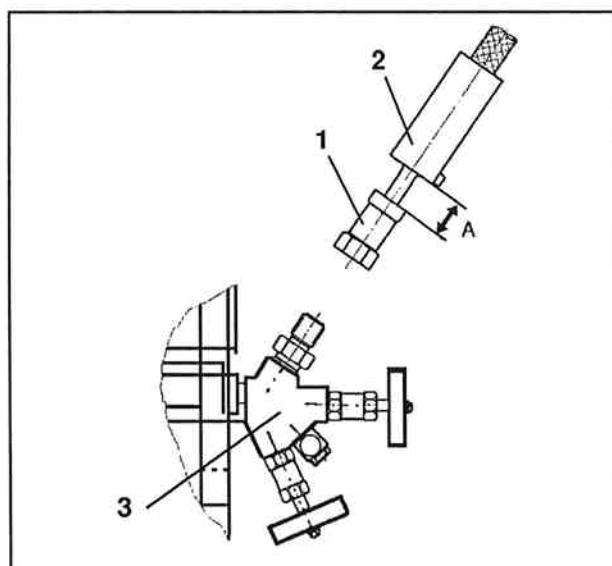

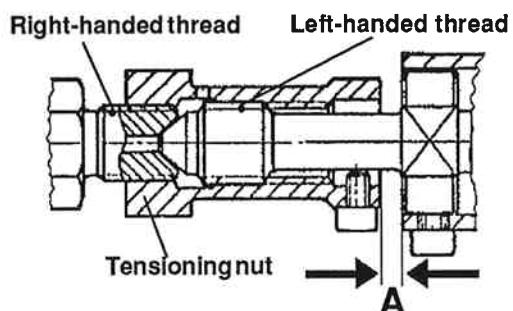

#### 5.4.1 Connecting the Return Hose

Connect the return hose to the unit and to the burster element. Push the hose couplings onto their counter-part until they are audibly locked into place.

#### IMPORTANT

Make sure that the couplings of the return hose are correctly locked into place.

### 5.4.2 Connecting HD Hose to the Unit

**NOTE**

1. Remove the protective cap (SW22) from the HD cock.

2. Unscrew the tensioning nut (1) of the HD hose (2) by turning it clockwise until its stop (maximum distance A).

3. Screw the tensioning nut (1) of the HD hose (2) onto the HD cock (3) and tighten it by means of the fork wrench (SW22) hand-tightly (minimum distance A).

**IMPORTANT**

If, after having tightened the tensioning nut, there is no distance A, tensioning nut and screw-type nipple must be replaced.

Fig. 5-7 Connecting HD-Hose to the Unit

### 5.4.3 Connecting High Pressure Hose to the Burster Element

**IMPORTANT**

For perfect functioning plug-type fittings and plug-type nipple must be in absolutely perfect condition.

1. Check whether

- the sealing rings of the plug-type fittings are correctly positioned and that they are not damaged;
- the plug-type nipple at the burster element is clean and that it is not damaged.

Damaged sealings are to be replaced according to 7.2.1.

2. Remove the securing nut (1, Fig. 5-8).

**IMPORTANT**

- Do not force. Do not jam the connections.
- Tighten securing nut (1) only manually.
- In case of oil losses replace the sealings of the HD plug-type fittings (2) (see 7.2.2)

3. Push the HD plug-type fittings (2) cautiously onto the plug-type nipple (3).

4. Fix the securing nut (1) and tighten it manually.

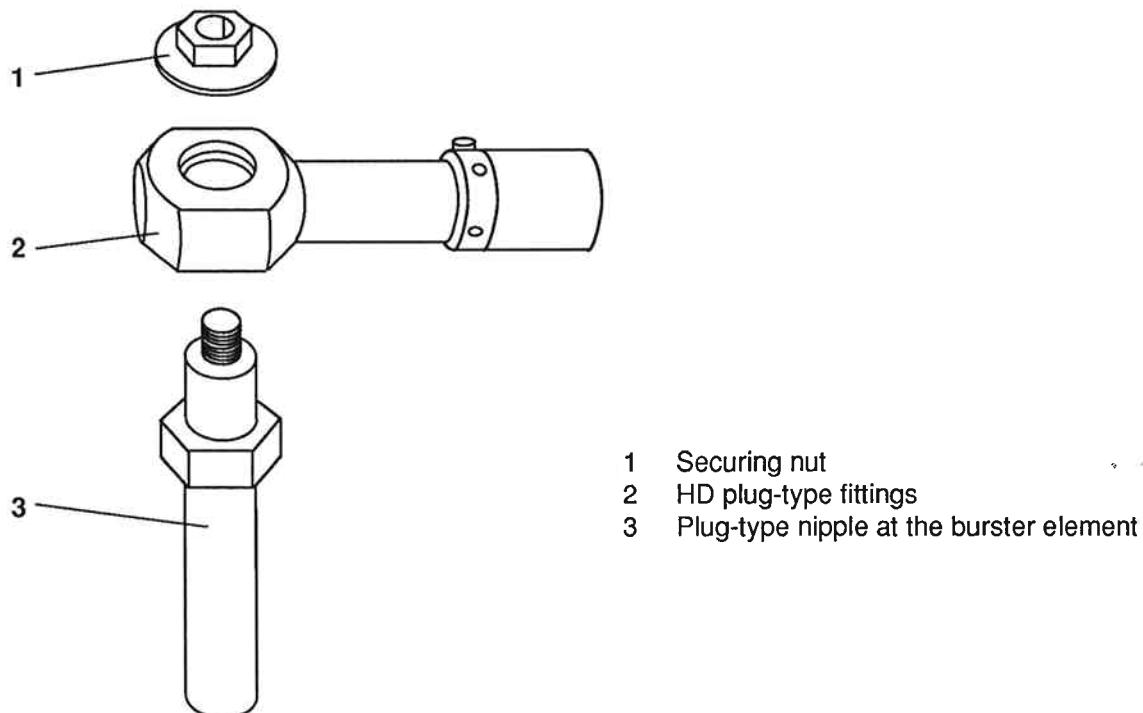

Fig. 5-8 Connecting HD Hose to the Burster Element

## 5.4.4 Prolonging HD Hose

Two or more HD hoses can be coupled together in order to obtain a greater hose length. For this purpose the plug-type fitting of the first and every further HD hose must be replaced by a screw-type fitting. By means of the HD double nipple (see Fig. 5-9) the two HD hoses can be screwed together. Order numbers, see Fig. 11-5.

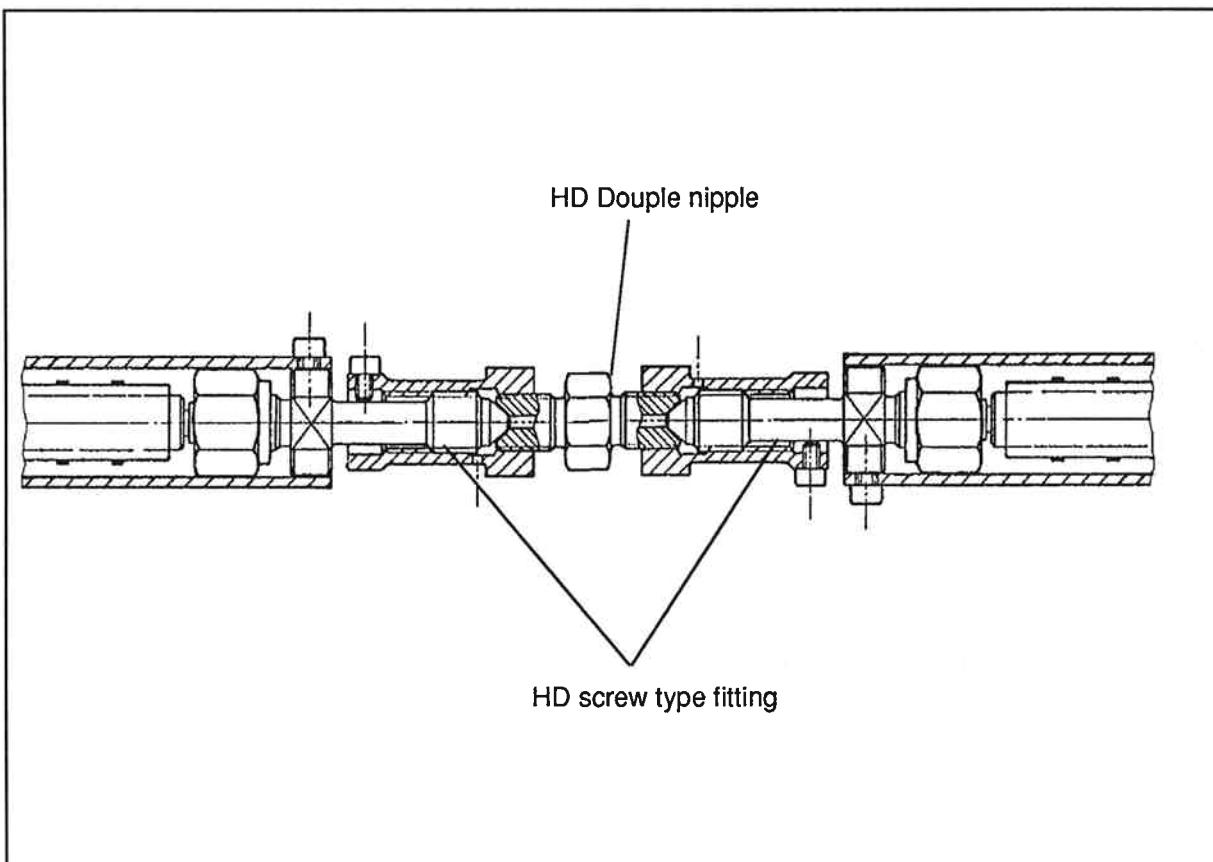

Fig. 5-9 Prolonging HD Hose

**5.4.5 Prolonging ND Hose**

The connection of the ND hoses can be carried out by means of the ND double nipple (order number, see Fig. 11-5).

## 6 OPERATION

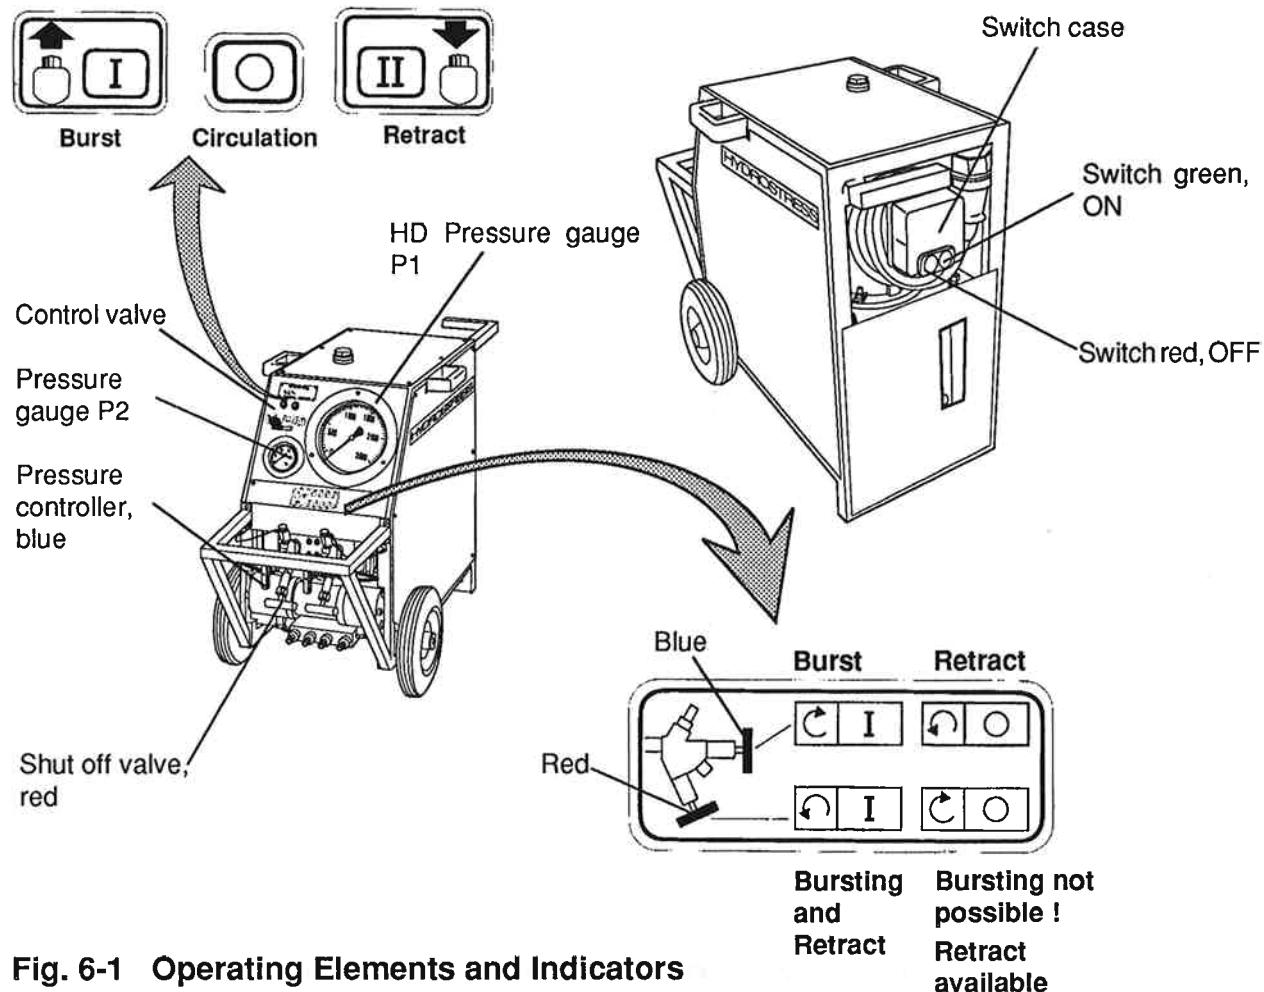

Fig. 6-1 Operating Elements and Indicators

### IMPORTANT

Do not close the shut-off valve RED and the pressure controller BLUE by force. Only tighten them slightly with two fingers.

### BEFORE STARTING

### IMPORTANT

When one of the HD cocks is not in use, its shut-off valve (RED) must be closed.

1. Set the control valve into position 0.
2. Pressure controller BLUE is open.
3. Shut-off valves RED of the connected HD circuits are open.
4. Shut-off valves RED of the disconnected HD circuits are closed.

### STARTING

Depress the switch (GREEN) at the switch case. The unit starts running.

## OPERATION

1. Set the control valve into position I, BURST.
2. Slowly close the pressure controller (BLUE): The burster element is supplied with pressure and The burster pistons extend. Check the pressure indication at the pressure gauge P1. Maximum admissible pressure is 2000 bar.
3. After having finished the bursting procedure switch the control valve into position 0. (The pressure at the burster element is maintained).
4. Open the pressure controller (BLUE) in order to reduce the pressure at the burster element to zero.
5. Set the control valve to position II. The burster pistons retract. Check the pressure indication at the pressure gauge P2. Maximum admissible pressure is 150 bar.
6. Switch the control valve into position 0.
7. Reposition the burster elements and repeat working steps 1 through 6.

### NOTE

**When the piston stroke is not sufficient, repeat working steps 1 through 6 and use the compression plate.**

## SWITCHING OFF

1. Depress the switch (RED) at the switch case. The power unit ist shut down.
2. Open the pressure controller (BLUE).

### CAUTION

- Never disconnect the hydraulic hoses when the motor is still running.
- Before disconnecting the hoses switch the control valve several times from position I to II and vice versa. Thus it is ensured that there is no pressure in the return circuit.

### IMPORTANT

- Keep the hose couplings always clean. Do not drop the hose couplings.
- In order to avoid damage to the hose couplings, never slide the hoses on the ground.

3. Remove the HD hose. Immediately place the dust caps on the HD cock.
4. Disconnect the ND hose. Immediately place the dust caps on the burster element.

## CLEANING

### IMPORTANT

**Cautiously clean the HD pressure gauge and the switch case.**

Clean the unit, the burster elements and the hoses with water or by means of a high pressure cleaning apparatus.

## 7 SERVICING AND MAINTENANCE

Maximum performance and optimum reliability of the concrete bursting system are obtained as long as you carry out the necessary maintenance works - or have them carried out - at regular intervals indicated in the following tables.

These maintenance works are specified as being obligatory by the manufacturer. HYDROSTRESS will reject any liability for damages resulting from nonobservance of the maintenance intervals and of maintenance works.

### CAUTION

Before carrying out any maintenance works make sure that the unit is currentless and that there is no pressure in the hydraulic system.

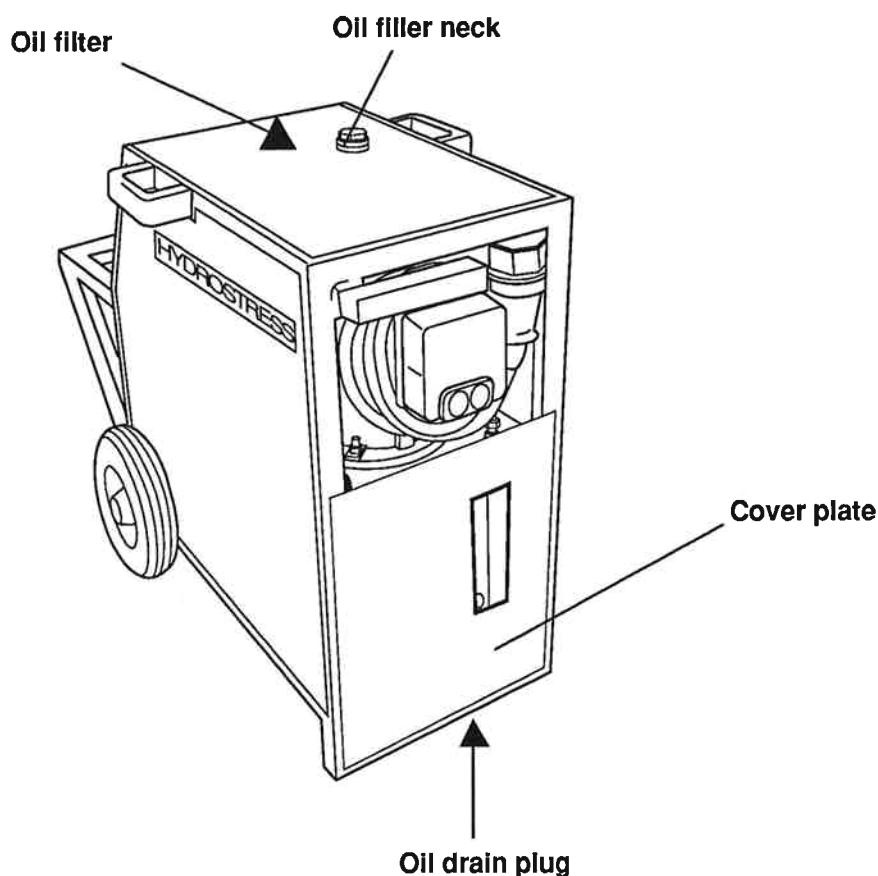

Maintenance Interval	Activity	Remarks
Daily	<ol style="list-style-type: none"><li>1. Check for leakage.</li><li>2. Check the firm seat of the hydraulic lines and that they are not damaged.</li><li>3. Check the burster heads for damage, if necessary, replace them.</li><li>4. Check couplings for:<ul style="list-style-type: none"><li>- leakage</li><li>- damage</li></ul></li><li>5. Clean the piston surface.</li></ol>	<p>Check cause of leakage and eliminate it.</p> <p>Tighten loose connections, replace defective parts.</p> <p>Have burster element SP with damaged burster heads repaired. Replace damaged burster heads of CP 110, see 7.2.1</p> <p>Replace or have replaced damaged couplings. Replace KSD sealings at leaking HD couplings, see 7.2.2</p> <p>Extend the pistons of the burster element. Clean the piston surface with an oilsoaked cloth.</p>

Tab. 7-1 Table of Maintenance Works SP/CP

Maintenance interval	Activity	Remarks
Daily	<ol style="list-style-type: none"> <li>1. Visual inspection of           <ul style="list-style-type: none"> <li>- leakage</li> <li>- dirt accumulation</li> </ul> </li>   <li>2. Check screw connections for firm seat</li> </ol>	<p>Detect and eliminate cause Clean with water, steam jet etc.</p> <p>Tighten loose screw connections</p> <div style="background-color: #e0e0e0; padding: 5px; border-radius: 10px; text-align: center;"> <b>IMPORTANT</b>  <b>Never operate the unit when the oil level is below minimum!</b> </div> <p>Do not refill above maximum!</p> <p>If necessary, replace couplings</p>
100 operating hours	<ol style="list-style-type: none"> <li>1. Change of hydraulic</li> <li>2. Clean the suction filter or replace it if necessary</li> </ol>	<div style="background-color: #e0e0e0; padding: 5px; border-radius: 10px; text-align: center;"> <b>IMPORTANT</b>  <b>Use only the prescribed hydraulic oils: Mobilfluid 316 or Mobil D.T.E. 15</b> </div>
200 operating hours	Major servicing	Is carried out either by HYDROSTRESS or an authorized HYDROSTRESS representation exclusively.

Tab. 7-2 Table of Maintenance Works AU

## 7.1 Oil Change and Cleaning of Filter

**Fig. 7-1 Oil Change and Cleaning of Suction Filter**

You need:

1. a collecting pan with a capacity of approx. 15 l for the old hydraulic oil;
2. a wrench, size 10 mm, for the oil drain plug;
3. oil filter band;
4. approx. 13 l hydraulic oil (see below);
5. a new filter.

### Oil Quality:

HYDROSTRESS recommends the following hydraulic oils:

For Switzerland: - Mobilfluid 316  
International: - Mobil D.T.E.15

After long years of experience these hydraulic oils have proved to be particularly long-lived and resistant.

**IMPORTANT**

- When these oils are not available, make absolutely sure to use branded hydraulic oil of equal quality. The following requirements must be met:
  - Pour point at least at -30 °C or lower
  - Viscosity index at least 150 or more
  - Viscosity class HLP VG 46 or ISO 3498 HV 46
  - Wearing protection according to DIN 51524, part 3 (HV 46)
- Replenish the oil reservoir with oil products of different brand only after having drained and cleaned the reservoir from the remaining oil, since mixtures of various hydraulic oils are subject to rapid aging.

CARRY OUT THE CHANGE OF THE HYDRAULIC OIL AND THE CLEANING OF THE FILTER AS FOLLOWS:

**CAUTION**

Avoid any direct contact with hydraulic oil. When it happens, however, wash the hydraulic oil off immediately.

1. Remove the rear cover plate.
2. Place the collecting pan.
3. Remove the cap from the oil filler neck.
4. Remove the oil drain plug and drain the hydraulic oil completely.
5. Fix the oil drain plug again.
6. Unscrew the oil filter.
7. Fix the new one.
8. Replenish with fresh hydraulic oil. Do not exceed the maximum level !
9. Dispose of the old hydraulic oil according to the legal regulations.

## 7.2 Replacement of Components

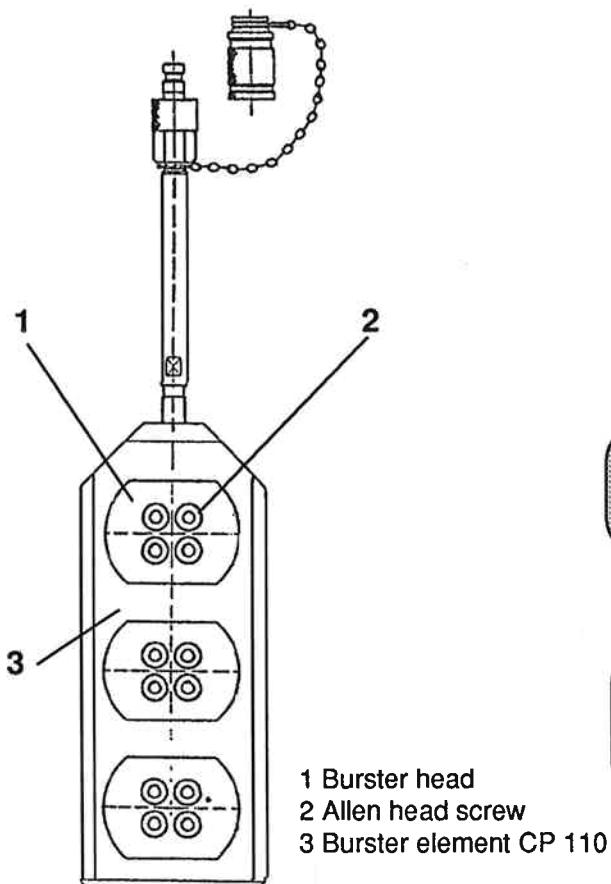

**Hydraulic system:** The replacement of components must only be carried out by personnel trained by HYDROSTRESS or similarly qualified staff. In the latter case please contact HYDROSTRESS or an authorized HYDROSTRESS representation prior to any replacement work.

**Electric system:** The replacement of components must only be carried out by qualified personnel (electrical engineers).

## 7.2.1 Replacing the Burster Head CP 110

### NOTE

Only the CP 100 burster heads can be replaced by personnel at the construction site. When the burster heads of the burster elements SP 140 or SP 280 are damaged, these can only be repaired by HYDROSTRESS.

### You need:

1. Allan key
2. Burster head (order no. 0001-53049-02)

### Replacement:

1. Four Allen head screws M 8 x 30 (2, Fig. 7-2)
2. Remove the burster head (1).
3. Insert new the new burster head.

### IMPORTANT

Insert the burster head by following exactly the instructions of Fig. 7-2.

4. Fix the new burster head by the four Allen head screws.

### IMPORTANT

Tighten the screw connections in crosswise direction.

### NOTE

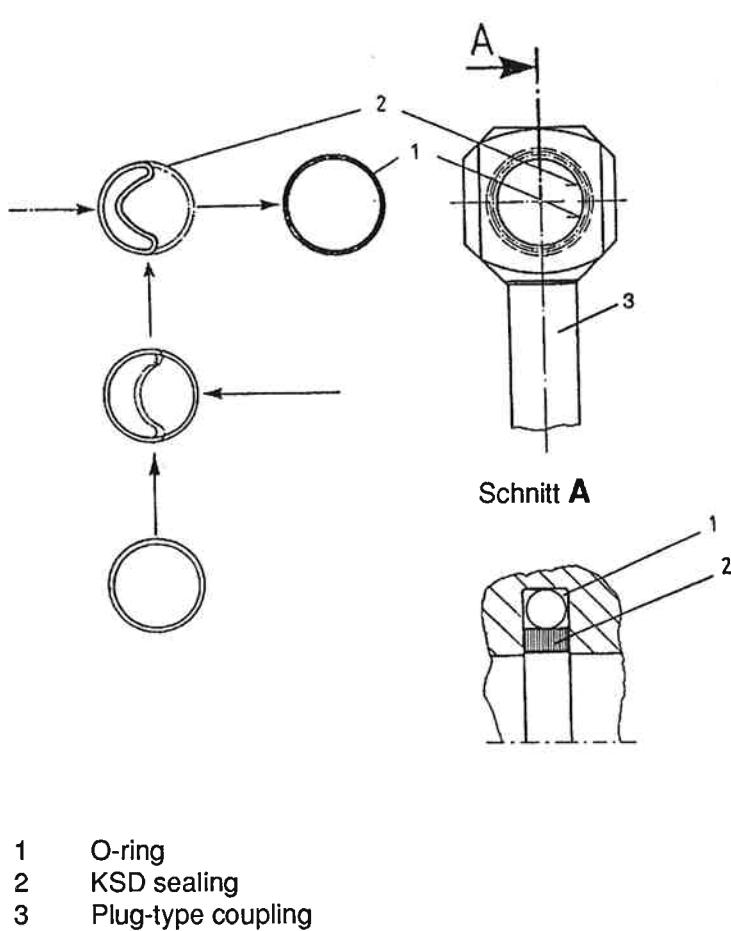

The borings for the burster pistons of the burster elements SP 280 and SP 140 can be reworked up to three times. Order no. for oversized pistons see Fig. 11-7 and Fig. 11-6.

**Abb. 7-2 Replacing the Burster Head CP 110**

	BURSTER PISTONS	BORING IN THE BURSTER ELEMENT
Standard	$\varnothing 89,85 \pm 0,01$	$\varnothing 90,00 +0,03$ $0$
1st oversize	$\varnothing 90,05 \pm 0,01$	$\varnothing 90,20 +0,03$ $0$
2nd oversize	$\varnothing 90,25 \pm 0,01$	$\varnothing 90,40 +0,03$ $0$
3rd oversize	$\varnothing 90,45 \pm 0,01$	$\varnothing 90,60 +0,03$ $0$

**Tab. 7-3 Sizes of Burster Pistons**

## 7.2.2 Replacing the KSD Sealing

- 1 O-ring
- 2 KSD sealing
- 3 Plug-type coupling

Fig. 7-3 Replacing the KSD Sealing

### You need:

1. O-ring and KSD sealing (order no. 05K5-00180-20)
2. Pointed tool (e.g. drawing pin, knife)

### Replacement:

1. Withdraw the old KSD sealing (2, Fig. 7-3) and the O-ring by means of a pointed tool from the plug-type coupling (3).
2. Check the open groove for remaining rests of the sealing, if necessary remove them.
3. Insert the O-ring (1) into the groove.
4. Insert the KSD sealing (2) as follows:
  - Fold the KSD sealing to a reniform shape and insert it into the plug-type coupling (3).
  - Press the reniform KSD sealing carefully into the groove by means of an edgeless object.

## 8 TROUBLESHOOTING

Proceed systematically when looking for the cause of defects. For this purpose also use the hydraulic scheme (see section 10).

If you cannot find the defect or eliminate the faulty condition, please contact our after-sales service. Before calling us, please observe the following:

- The better you describe the defect, the better we can help you.
- Have the operating instructions (hydraulic scheme) at hand.
- Note machine type and machine number of your unit.

### Unit AU

Trouble	Cause	Remedy
Unit does not run but power supply is connected.	The unit receives no voltage because <ul style="list-style-type: none"><li>- the power supply cable is defective.</li><li>- power supply at the construction site is defective.</li></ul>	Replace the cable.  Check power supply at the construction site.
The electr. motor hums after starting; no power.	Motor runs on two phases only.	Check the fuses. Consult an electrician.
The unit starts and then switches off.	Fuse protection of the construction site responds..	Fuse value is too low. Use another power supply source.
No pressure build-up in the HD circuit HD circuit	1. Unit is defective  2. Burster element is defective	Connect HD hose to the HD connection and check pressure build up  If yes: <ul style="list-style-type: none"><li>- burster element is defective</li></ul> If no: <ul style="list-style-type: none"><li>- unit is defective</li></ul>
No pressure build-up in the ND circuit	1. Unit is defective  2. Burster element is defective	Connect return hose to the ND connection and check pressure build up  If yes: <ul style="list-style-type: none"><li>- burster element is defective</li></ul> If no: <ul style="list-style-type: none"><li>- unit is defective</li></ul>
Maximum power of the unit is not available.	Pump is defective.  Electric defect.	Contact our aftersales service.

Fig. 8-1 Troubleshooting Chart, Unit AU (page 1 of 2)

## Unit AU

Trouble	Cause	Remedy
The unit stops running during operation.	<p>Power supply is interrupted.</p> <p>Protective motor switch responds:</p> <ol style="list-style-type: none"> <li>1. Cross section of incoming cable too small</li> <li>2. Defective plug connections</li> </ol>	<p>Check power supply.</p> <div style="border: 1px solid black; padding: 5px; background-color: #f0f0f0; border-radius: 10px; margin-top: 10px;"> <b>CAUTION</b>            Before opening the control unit, check that the unit is currentless.         </div> <p>Use cable with specified cross section (see section 5.1).</p> <p>Check the plug connections, replace them, if necessary.</p>
Hydr. coupling leaks	<p>Coupling not screwmounted as specified</p> <ol style="list-style-type: none"> <li>1. Coupling defective</li> <li>2. Sealing defective</li> </ol>	<p>Screw the coupling on according to 5.4.</p> <p>Replace hydraulic hose</p>

Fig. 8-1 Troubleshooting Chart, AU (page 2 of 2)

## Burster head SP/CP

Trouble	Cause	Remedy
No pressure build-up	<ol style="list-style-type: none"><li>1. HD screw connection is leaking or is not mounted correctly</li><li>2. Unit is defective</li><li>3. Burster element defective (inner leakage, HD sealing defective)</li></ol>	<p>Check screw connection (oil leakage). Connect HD hoses according to 5.4. Replace connecting parts.</p> <p>Check the unit:</p> <p>Connect the hoses and build up pressure. Check whether a pressure of 1800 bar are reached. If not so, pump, booster or HD cock are defective.</p> <p>Have them replaced by HYDROSTRESS or by a HYDROSTRESS representation.</p> <p>Replace burster element.</p>

Fig. 8-2 Troubleshooting SP/CP

## 9 ACCESSORIES

The standard equipment comprises the following accessories:

- Hydraulic-Hoses
  - High pressure hose
  - Return hose
- Tool kit with following contents (see Fig. 11-9):
  - Ring/fork wrench SW19
  - Ring/fork wrench SW22
  - Ring/fork wrench SW24
  - Rod sealing 18 60%
  - Dust cap for nipple
  - 3 protective caps for internal screw thread 1/4"

Quantity according to order  
Quantity according to order

### Optionally available:

- 4-way distributor for HD cock  
Order no. 99MP-51396-01
  - Possible connection of four burster elements to a HD cock
- Screw-type nipple to HD line  
Order no. 0004-52578-0
  - Enables the direct screw connection of the HD hose to the HD line at the burster element (e.g. for SP 280) as follows:
    - Remove HD plug-type coupling (1, Fig. 11-5) and replace it by screw-type nipple (5) with tensioning nut (6).
    - Remove plug-type nipple (19, Fig. 11-6) and replace it by screw-type nipple (20).
- Double nipple for HD hoses  
Order no. 0001-50771-04
  - Enables the screw-connection of two HD hoses (8, Fig. 11-5)
- Double nipple for ND hoses  
Order no. 20HS-AU004
  - Enables coupling connection of two ND hoses (11, Fig 11-5)

## **11.1 Bestellangaben**

Für Ersatzteilbestellungen benötigen wir folgende Angaben:

1. Maschinentyp gemäß Typenschild (z. B. BW 001)
2. Nennspannung und Frequenz gemäß Typenschild (z.B. 380 V - 3N ~ 50Hz)
3. Maschinennummer gemäß Typenschild (z. B. 2136)
4. Ersatzteilnummer (z. B. 08W7-75648-02)

Für Bestellungen, Fragen und Informationen wenden Sie sich bitte an unsere für Sie zuständige Niederlassung (siehe unten).

## **11.1 Description of orders**

For spare part orders we need the following indications::

1. Type of machine, according to type plate (e.g. BW 001)
2. Standard voltage and frequency according to type plate (e.g. 380 V - 3N ~ 50Hz)
3. Number of machine, according to type plate (e.g. 2136)
4. Stock number of spare part (e.g. 08W7-75648-02)

For orders, inquiries and information, please refer to your responsible branch office (indicated below).

## **11.1 Spécifications effectuées à la commande**

Prière d'indiquer les spécifications suivantes pour toute commande de pièces de rechange :

1. Type de machine selon plaque d'identité (p.ex. BW 001)
2. Puissance connectée selon plaque d'identité (p.ex. 380 V - 3N ~ 50Hz)
3. Numéro de machine selon plaque d'identité (p.ex. 2136)
4. Numéro de la pièce de rechange (p.ex. 08W7-75648-02)

Prière de contacter notre filiale (voir ci-dessous) pour toute commande, question ou renseignement .
